INSTRUCTION MANUAL

FOR

TYPE WJ-8610 SERIES RECEIVER

WATKINS-JOHNSON

INSTRUCTION MANUAL

FOR

TYPE WJ-8610 SERIES RECEIVER

The TYPE WJ-8610 SERIES RECEIVER manual covers the WJ-8616A and WJ-8617A receivers. Differences between the receivers are described in the WJ-8610 Series Receiver Configurations Table (Table 1-0) and the WJ-8610 Series Receiver, Specifications (Table 1-1). Descriptions of the documented options are provided in the Appendix.

WATKINS-JOHNSON COMPANY
700 QUINCE ORCHARD ROAD
GAITHERSBURG, MARYLAND 20760

WARNING

This equipment employs voltages which are dangerous and may be fatal if contacted. Extreme caution should be exercised in working with the equipment with any of the protective covers removed.

PROPRIETARY STATEMENT

ADDENDA

The following operating changes apply to all WJ-8610A Series and WJ-8618A Receivers containing 1.6.1 version software. This software is installed in and affects the operation of WJ-8616A Receivers, serial no. 16 and above, WJ-8617A Receivers, serial no. 57 and above, and WJ-8618A Receivers, serial no. 56 and above.

Paragraph	
2.4.1.1	Push ON/OFF Power - When the Power ON/OFF pushbutton is placed in the ON position, a delay of approximately 1/2 seconds will occur before the front panel illuminates.
2.4.2.3	SCAN Mode - The width of each SCAN band is limited to 64000 frequency increments for each band. The maximum frequency coverage of each band is equal to the SCAN INCREMENT (see Table 2-3 of Section II) times 64000. Table 2-3 - The SCAN INCREMENT for the 10 KHz IF bandwidth has been changed from 10 KHz to 5 KHz.
2.4.2.3.3	LOCK-OUT Channel Recall and Deletion - In addition to LOCK-OUT Channel Recall and Deletion, the capability of setting the receiver to the frequency and bandwidth of the recalled LOCK-OUT Channel has been added. This is accomplished by recalling the LOCK-OUT Channel, as described in 2.4.2.3.3 and then depressing the EXC (Execute) push-button.
2.4.2.6	CURSOR - The operation of the cursor mode has been modified, as follows: A) Selection of the Cursor mode and activating a Cursor Scan no longer require two seperate steps. Depressing the Cursor (Scan) push-button one time, after selecting the upper case function, selects the Cursor mode and Activates the Cursor Scan. B) When in the cursor mode, the Signal Monitor can be restored to its standard operation by depressing the MAN pushbutton.

2.4.2.7 ERROR CODES - The three-digit error codes, 501 and 502, have been changed to codes 551 and 552, respectively.

Error Code 812 has been added. This code will be displayed if a SCAN is initiated when the width of the Scan band requires more than 64000 incremental steps. If this code is displayed, either the width of the frequency spectrum to be scanned must be decreased, or the programmed IF bandwidth must be increased to increase the size of the SCAN increments.

APPENDIX

TABLE OF CONTENTS (Cont'd)

APPENDIX (Cont•d)

SECTION I

GENERAL DESCRIPTION

1.1 ELECTRICAL CHARACTERISTICS

The WJ-8610 Series consists of the WJ-8616A and WJ-8617A Receivers. Refer to the WJ-8610 SERIES RECEIVER CONFIGURATIONS, Table 1-0 (pages x through xii), for the modular differences between the WJ-8610 Series Receivers. The WJ-8610 Series Receivers were designed to fill the need for general purpose, digitally controlled receivers in the VHF/UHF range. The chassis of each receiver is identical with expansion capability built into the circuitry. This provides ease of modification by interchanging modules from the various receivers or adding optional modules to increase the receiver capabilities. In most cases, receiver modification consists of simply inserting an option module into an existing option connector on the chassis. Refer to the APPENDIX manual for a description, parts list and schematic diagram of the various options available.

The standard receivers are designed to receive AM, FM, CW and PULSE emissions over a frequency range from 20 to 1100 MHz. Refer to Table 1-1, WJ-8610 SERIES RECEIVER SPECIFICATIONS, for the specific frequency range of each receiver. The receivers are capable of manual operation and remote operation with the IEEE-488 bus or RS-232 interface option installed. In the manual mode, operating parameters are selected by depressing the appropriate pushbutton. When depressed, an illuminated LED, on the pushbutton indicates the selection. A digital display, composed of seven-segment LEDs, indicates tuned frequency, BFO offset frequency (optional), selected memory channel, relative signal strength and COR level selected.

A built-in memory provides 16 operator-programmed memory channels in the Manual and Step modes or 8 programmed frequency search bands in the Scan mode. The memory controls all receiver functions including tuned frequency, antenna selection, IF Bandwidth, Detection Mode, COR level, AGC ON/OFF and AFC ON/OFF. In the manual mode, the operator has full control of all receiver functions. In the step mode, the built-in microprocessor directs the receivers to step to each frequency stored in the memory channels in search of signal activity. In the scan mode, the microprocessor directs the receivers to search the operator-programmed bands for signal activity.

Internal frequency tuning circuitry of the WJ-8610 Series receivers include the 1st and 2nd LO Synthesizers and the 3rd synthesizer. The synthesizers determine the tuned frequency to a resolution of 100 Hz. A tuning knob on the front panel and three tuning rate pushbuttons provide tuning capability. Tuning can be performed in 1 MHz, 10 kHz or 100 Hz steps by selecting the appropriate tuning rate button. Pressing the Disable button locks the receiver to the selected frequency and disables the tuning knob, to prevent accidental frequency changes.

Ease of maintenance and flexibility is provided by the modular design concept. Nearly all functional modules plug directly into the motherboards and the connections are accessible from the bottom of the receiver, with the bottom panel removed.

1.2 MECHANICAL CHARACTERISTICS

Each receiver mounts in a standard 19-inch equipment rack, occupies 5.25 inches of vertical space and extends 19.9 inches into the rack. The main chassis top, bottom, front, rear and internal compartment panels are constructed of aluminum. Except for the Line Audio

control, which mounts on the rear panel, all operating controls are mounted on the front panel, while all input and output cables (except for the phones jack and optional tuning connector) connect to the rear panel.

A black bezel, etched with control markings, is mounted to the front panel. The pushbuttons, Display LEDs, dwell control and Optional Tuning connector all mount on a printed circuit board, positioned behind the front panel, and extend through cutouts in the front panel and bezel. All other controls (except for the ON/OFF Power Button) mount to the front panel. The power ON/OFF button mounts to the chassis and extends through the front panel and bezel.

The rear panel mounts all input and output connectors, except for the phones jack and Optional Tuning connector, mentioned above. N-type connectors are supplied for the ANT 1 and ANT 2 inputs. All other connectors are BNC type. The REF SEL switch for selecting an internal or external timebase is mounted immediately above the 1 MHz reference input/output connector. Line Audio control, R3, which controls the rear panel audio output is mounted on the rear panel along side of the audio output connector. Two rear mounted fuse holders are provided. The rectangular holder mounts the operational line fuse while the circular holder is used to house the alternate line voltage fuse. Also mounted on the rear panel are four heat sinked voltage regulators (for +15 V, -15 V and +5 V) and two rectifiers (for +9 V unregulated).

The top cover is held in place using 33 quarter-turn fasteners. Loosening these fasteners permit removal of the top cover, exposing the five main compartments. The power distribution circuit, signal monitor assembly compartment, RF/IF modules, Digital I/O modules and synthesizer modules are in separate compartments for mechanical support and shielding purposes. Removal of the top cover permits access to all of the plug-in modules.

Removal of the bottom cover, held in place by 31 quarter-turn fasteners, exposes the optional wideband IF amplifier and the three motherboards that mount the plug-in modules. All connections to the motherboards are made with push-on plugs so that replacement of a motherboard consists of removal of mounting screws and the plugs.

1.3 EQUIPMENT SUPPLIED

The equipment supplied consists of the receiver and a detachable line cord.

1.4 EQUIPMENT REQUIRED BUT NOT SUPPLIED

To obtain full use of the receiver, equipment from the following list should be selected.

1) Two antennas, 50-ohm

2) Audio monitoring equipment

   speaker panel, 600-ohm
   headphones set, 600-ohm
   tape recorder

3) HP-9825S calculator, with IEEE-488 option, for remote control operation

4) Computer terminal and/or line printer, with RS-232 option, for remote-control operation

5) IF-tape converter, 21.4 MHz to video

Table 1-1. WJ-8610 Series Receiver, Specifications

Frequency Range:	
WJ-8616A	20 - 500 MHz
WJ-8617A	20 - 1100 MHz
Detection Modes	AM, FM, CW and Pulse standard, Variable BFO, SSB and LOG optional (other modes are available on special order)
Tuning Scheme	Frequency synthesized local oscillators locked to internal reference
Reference Accuracy	1 part in 10^{-6} or external 1 MHz reference input (1 part in 10^{-7} optional)
Tuning Resolution	100 Hz
Synthesizer Tuning Speed	500 µs typical, 1 msec maximum, integers of 10 kHz and greater step size
Input Impedance	50 Ω
Input VSWR	2.5:1 Typical 3.0:1 Maximum
Noise Figure*	9.5 dB, Typical 11 dB maximum, 20 - 500 MHz; 10.5 dB, Typical 11 dB maximum, 500 - 1,100 MHz
Third Order Intercept Point	0 dBm typical
Second Order Intercept Point	+50 dBm, minimum
Preselection	Automatically switched, suboctave bandpass filters
LO Radiation	-100 dBm typical; -90 dBm, maximum
Image Rejection	100 dB typical; 90 dB, minimum
IF Rejection	95 dB typical; 90 dB, minimum
Internal Spurious	Equivalent to -110 dBm maximum at the RF input
Reciprocal Mixing	With an input signal at a rated sensitivity level; an out-of-band signal removed seven times the 50 kHz IF bandwidth at a level 70 dB above rated sensitivity will not degrade the desired output signal ratio (S+N)/N by more than 3 dB.
IF Bandwidths	4 IF bandwidths standard (see Table 1 for standard available bandwidths)
IF Shape Factor	3:60 dB. See Table 1
Final IF	21.4 MHz, -20 dBm Nominal Output Level
AM Stability	6 dB maximum from AGC threshold to a level 100 dB above AGC threshold (maximum input -5 dBm)
Switched Video Output	1 volt peak to peak, minimum, into 91 ohm load for FM with peak frequency deviation at 30% of the IF Bandwidth and AM with 50% modulation. DC coupled for FM and AM
FM Monitor	DC coupled FM output, 1 volt peak minimum, into 91 ohm load

Table 1-1. WJ-8610 Series Receiver, Specifications (Cont'd)

Table 1. Standard Available Bandwidths

Bandwidth (kHz**)	Shape Factor 3:60 dB BW	20-1100 MHz †* Sensitivity (dBm)
10	3:1	-104
20	3:1	-101
50	3:1	-97
75	3:1	-95
100	3:1	-94
250	4:1	-90
300	4:1	-89
500	5:1	-87
1000	4:1	-84
2000	4:1	-81
4000	4:1	-78

Video Amplifier Frequency Response	DC to ≈ 1/2 IF Bandwidth for FM Monitor; DC to ≈ 1/2 IF Bandwidth for AM/FM Switched Video Output
Line Audio Output	10 mW, minimum, into 600 ohms for 50% AM or FM peak frequency deviation equivalent to 30% of the IF bandwidth
COR/Squelch	Adjustable threshold from noise level to approximately 40 dB above noise. COR provides 100 mA current "sink-to-ground" for switching; +24 Vdc maximum external voltage. (External current limiting must be provided.)

*Antenna switch option add 1 dB to noise figure and sensitivity.

**Unless otherwise specified the Receiver is provided with 20, 50, 300 kHz and 2 MHz IF Bandwidths.

†Sensitivity Conditions:

AM - Input signal AM modulated 50% by a 1 kHz tone, will produce a minimum video output (S+N)/N ratio of 10 dB.

FM - Input signal FM modulated at a 1 kHz rate with a peak deviation equal to 30% of the selected IF BW, will produce a minimum video output (S+N)/N ratio of 17 dB. (Note: A 400 Hz modulation rate is required for the 10 kHz IF BW.)

Table 1-1. WJ-8610 Series Receiver, Specifications (Concluded)

Signal Monitor:	
Sweepwidth	0 - 4 MHz continuously adjustable
Resolution	10 kHz
Sweep Rate	Adjustable to 15 - 25 Hz
Marker	Center frequency (locked to receiver frequency standard)
Display	Lin/Log
CRT	1 x 3 inches nominal dimensions
PAN	Provides pan display during SCAN/STEP modes with optional digitally refreshed display
Temperature Range:	
Operating	$0^{\circ}C$ to $50^{\circ}C$
Non-Operating	$-20^{\circ}C$ to $80^{\circ}C$
Power Requirement	110, 120/220, 240 Vac; 47-400 Hz; 105 watts
Dimensions	19-inch rack mount, 18-inch depth (excluding connectors and handles), and 5.25 inch panel height
Weight	50 pounds, approximately

Receiver Inputs/Outputs:

- Antenna Input (Type N) (2)
- External Reference Input (BNC)
- Optional Tuning Input (Front Panel)
- Optional Remote Control In/Out (IEEE-488) (RS-232C) (MIL-STD-188C)
- Wideband 21.4 MHz IF Output (BNC)
- Selected Bandwidth 21.4 MHz IF Output (BNC)
- COR (BNC)
- FM Monitor Output (BNC)
- AM/FM Video Output (BNC)
- Audio Output (600 Ω BNC, Rear Panel Adjustable)
- Phone Output (Front Panel, Front Panel Adjustable)
- Optional Display X-Y Outputs (BNC)
- AC Input

SPECIFICATIONS NOTE

The specifications and the design of the Type WJ-8610 Series VHF/UHF Receivers as indicated in the preceding table are subject to change in accordance with modification improvements.

SECTION II

INSTALLATION AND OPERATION

2.1 UNPACKING AND INSPECTION

Examine the shipping carton for damage before the equipment is unpacked. If the carton's exterior appears to be damaged, try to have the carrier's agent present when the equipment is unpacked. If this is not possible, retain all packing material and shipping containers for the carrier's inspection if damage to the equipment is evident after it has been unpacked. Also, verify that the equipment is complete as listed on the packing slip. Contact the Watkins-Johnson Company or your Watkins-Johnson representative for any discrepancies or shortages.

2.2 INSTALLATION

The receiver is designed for mounting in a standard 19-inch equipment rack. It occupies 5.25 inches of vertical rack space and extends approximately 19.5 inches into the rack to the tips of the rear protective handles. Do not rely solely on front panel mountings to support the receiver. The use of Jonathan Type QD110 slides, mounted to the sides of the receiver, is preferred. The rack should allow a free flow of air through the top and bottom covers and the side panels, as well as around the outer surfaces of the receiver.

Access to the rear panel should be allowed so that input and output connections can be made or changed conveniently, if desired.

The front and rear panel connections are described in Table 2-1. As a reference for the panel connectors, refer to Figure 2-1.

NOTE

Before power is applied to the unit be sure that the selected line voltage for the receiver matches the line voltage being used.

2.2.1 CONNECTOR SIGNALS

2.2.1.1 Line Cord Receptacle And Voltage Selector Fuse Block - This multi-functioned assembly should always be inspected before installation of the receiver in a new location. With the line cord unplugged, the clear plastic window can be slid over the male power receptacle prongs. This exposes the line fuse and a hinged plastic fuse pull lever.

Swinging the lever to the left ejects the fuse from the holder and frees a line-voltage-select pc wafer, at the bottom of the assembly. Looking down on the pc wafer, at a slight angle, the selected line voltage for the receiver will show on the left side (either 100, 120, 220, 240 Vac). If the voltage shown does not match the available line voltage, remove the pc wafer and install it so that the closest line voltage is visable with the pc wafer in position. The pc wafer should be set in the voltage position closest to the line voltage being used. Then, install the fuse suitable for the line voltage: 1 ampere slow-blow for 100 Vac and 120 Vac or 1/2 ampere for 220 Vac and 240 Vac. Install the other fuse in the alternate fuse holder.

Table 2-1. Table Of Connectors

ANT 1	ANTENNA INPUT	(Type-N) RF Input From #1 Antenna
ANT 2	ANTENNA INPUT	(Type-N) RF Input From #2 Antenna
J1	SW IF OUT	(BNC) Selected Bandwidth IF Output (50 ohms)
J2	FM MON	(BNC) FM Monitor Output (93 ohms)
J3	AUDIO	(BNC) AUDIO Output (600 ohms)
J4	SW VIDEO OUT	(BNC) AM/FM Video Output (93 ohms)
J5	SCAN OUT	(BNC) Scan Output
J6	X OUT	(BNC) SM Display Output
J7	Y OUT	(BNC) SM Display Output
J8	1 MHz REF	(BNC) 1 MHz Reference In/Out (50 ohms)
J20	WB IF OUT	(BNC) Wideband IF Output (50 ohms)
J21	COR	(BNC) Carrier Operated Relay
J22	REMOTE CONTROL	Remote Control Input/Output (optional)
A7J1	PHONES	Phone Output (Front Panel)
A6J1	OPTIONAL TUNING	Optional Tuning Input (Front Panel)
FL1J1	Line Cord Receptacle and Voltage Selector	Power Input

2.2.1.2 Antenna #1 Input ANT 1 - This N-type connector provides the RF input signal from the #1 antenna. Nominal input impedance is 50 ohms.

2.2.1.3 Antenna #2 Input ANT 2 - This N-type connector provides the RF input signal from the #2 antenna.

2.2.1.4 SW IF OUT J1 - The switched IF output BNC connector supplies a -20 dBm IF signal into 50 ohms. The center frequency is 21.4 MHz with a bandwidth equal to the selected IF bandwidth.

2.2.1.5 FM MON J2 - The FM Monitor BNC connector provides a DC coupled FM output. The level will be 1 volt peak, minimum, into 93 ohms.

2.2.1.6 Audio J3 - This BNC connector provides a 600 ohms audio output. This output will drive a 600 ohm load at a level to 10 mW minimum. The output level is controlled by Line Audio Control R3.

2.2.1.7 SW Video Out J4 - This Switched Video Output BNC connector provides a 1 volt peak, minimum, video signal into a 93 ohm load. The output is a DC coupled AM or FM video signal, determined by the operation mode chosen.

2.2.1.8 SCAN OUT J5 - The Scan Output BNC connector is a special sinewave output that varies in frequency with the sweep (with ASO option installed).

2.2.1.9 X OUT J6 - This BNC connector provides X axis signal monitor information to drive an external display (with DRD option installed).

2.2.1.10 Y OUT J7 - This BNC connector provides Y axis signal monitor information to drive an external display (with DRD option installed).

2.2.1.11 1 MHz REF J8 - With the REF SEL switch in the internal position, this BNC connector will provide a 1 MHz output with a level of 100 mV rms into 50 ohms In the external position, a 1 MHz reference signal must be applied to J8 to provide a time base for the receiver. The level of the external signal must be at least 100 mV but less than 5 V. into 50 ohms.

2.2.1.12 WB IF OUT J20 - The Wideband IF Output BNC connector provides a -30 dBm IF signal into 50 ohms. The center frequency is 21.4 MHz with a bandwidth of 4 MHz.

2.2.1.13 COR J21 - The Carrier-Operated-Relay BNC connector provides a 100 mA current-sink to ground for control of external equipment. The maximum external voltage that can be applied is +24 VDC.

2.2.1.14 Remote Control J22 (optional) - The Remote Control multipin connector allows the receiver to interface with other equipment via an optional interface bus. This permits the receiver to be controlled from an external source or it can be programmed to supply signals to other receivers.

2.2.1.15 Phones A7J1 - The Phones Jack, mounted on the front panel, provides an audio signal of 10 mW, minimum, into 600 ohms. This signal is capable of driving a standard 600 ohm headphone set.

2.2.1.16 Optional Tuning A6J1 - The optional tuning multipin connector, permits receiver control using an optional external keyboard.

2.3 EQUIPMENT MALFUNCTIONS

This unit was thoroughly inspected and factory adjusted for optimum performance prior to shipment. If any malfunctions are encountered after following the recommended installation procedures, verify that the correct input signals are present at the proper jacks. Maintenance and troubleshooting of the unit can be aided by using the schematics shown in Section IV of this manual. Contact with your Watkins-Johnson representative or the Watkins-Johnson Company, CEI Division, Gaithersburg, Maryland should be made, to prevent possible voiding of the warranty prior to taking any corrective maintenance action.

2.4 OPERATION

All operating controls and displays are described in Table 2-2. Depression of a pushbutton will illuminate an LED on the button, indicating that particular function is active. Depressing any pushbutton in a group will deactivate any previously selected button in that group.

2.4.1 CONTROLS AND INDICATORS

2.4.1.1 Push ON/OFF Power - This pushbutton applies power to the unit. When pushed, the button will remain partially depressed, indicating the switch is energized. Depressing the button again will cause the button to return to its fully extended OFF position.

On power up, the receiver will be set to the operating mode and parameters that were present prior to the last power interruption. However, if the Scan mode was active when the receiver was last turned off, it will return at the beginning of the scan sequence, rather than at the point where power was interrupted.

Table 2-2. Table of Controls and Indicators

PUSH ON/OFF POWER	Applies power to the receiver.
DETECT MODE (AM, FM, CW, PLS)	Selects the mode of operation.
BANDWIDTH	Selects the IF bandwidth.
AFC	Activates automatic frequency control.
AGC	Activates automatic gain control to the RF and IF amplifiers.
COR LEVEL UP/DOWN	Selects the level at which the COR function activates.
MEMORY SELECT UP/DOWN	Selects the desired memory channel.
BFO	Optional feature to permit variation of BFO frequency when the Variable BFO Option is installed.
TUNING RATE PUSH (1 MHz, 10 kHz, 100 Hz)	Selects the increments of the frequency being tuned
TUNING KNOB	Controls the tuned frequency of the receiver.
DISABLE	Locks receiver to the displayed frequency and disables tuning knob.
ANT 2	Selects RF input from Antenna 2.
STO	Stores the selected receiver functions into the displayed memory channel.
MAN	Selects manual operation.
REM	Selects either the local or remote mode of operation.
RCL	Recalls and displays information stored in active memory channel.
EXC	Sets receiver in accordance with active memory channel.
CLR	Resets the receiver front panel and clears the memory.
SCAN	Scans operator programmed bands for signal activity.
STEP	Steps to each frequency stored in the memory channels in search of signal activity.
DWELL	Sets the period spent at each frequency or band in the SCAN and STEP modes.
AUDIO GAIN	Controls the audio signal at the Phones Jack.
RF/IF GAIN	Manually controls the gain of the RF and IF amplifiers
INTENSITY	Controls the intensity of the Signal Monitor's CRT
FOCUS	Provides focus of the trace on the CRT.
SWEEP RATE	Controls the rate at which the Signal Monitor sweeps the spectrum.
SWEEP WIDTH	Controls the width of the spectrum being viewed.
CENTER FREQ	Controls the horizontal position of the IF band displayed.

Table 2-2. Table of Controls and Indicators (Continued)

GAIN	Controls the amplitude of the signal displayed on the CRT
MARKER	Superimposes a 21.4 MHz reference marker on the IF signal displayed.
LIN/LOG	Selects either a linear or logarithmic vertical display.
DIGITAL DISPLAY	Displays digitally the COR LEVEL SELECTED. Relative Signal Strength, BFO offset frequency, Memory Channel selected and the Receiver Tuned Frequency.

2.4.1.2 DETECT MODE - Depressing a button in the DETECT MODE group will select the desired receiver detection mode. An LED on the pushbutton will light indicating the active mode. The operator may select standard AM, FM, CW or PULSE modes. LOG, USB and LSB are optionally available.

2.4.1.3 BANDWIDTH - This group of pushbuttons allows the operator to select one of four IF bandwidths (5th IF bandwidth optional). An LED will light on the active button. indicating the selected bandwidth.

2.4.1.4 AFC - Depression of the AFC pushbutton switches the Automatic Frequency Control circuitry on (AFC LED illuminated) or off (AFC LED extinguished). When this function is enabled, it will correct for any frequency drift to keep the receiver locked on to the desired signal. as long as the signal strength is sufficient to exceed the programmed COR level.

NOTE

1. IF AFC is selected, the COR level should be set such that the COR LED is off when no signal is present. This will prevent the AFC circuitry from hunting or attempting to correct the RF frequency, in the absence of a valid signal.

2. With two signals in close proximity, the AFC could lock on to the stronger signal. Therefore, when monitoring a low level signal, in the presence of stronger signals close in frequency to the desired signal, it is advisable to select AFC OFF.

2.4.1.5 AGC - Depressing the AGC pushbutton switches control of the RF/IF gain between Automatic Gain Control (AGC LED illuminated) and Manual Gain Control (AGC LED extinguished). When in the AGC mode, the RF/IF gain is automatically controlled by the internal AGC circuitry. In the Manual Gain Control mode, receiver RF/IF gain is set by rotaing the front panel RF/IF Gain control. During a scan, if AGC is selected as one of the programmed parameters, it will be off during the scan and the receiver will be set at maximum gain. When a signal is detected and the receiver is set to the "Scan Continue" mode, the AGC will be then activated to control receiver gain.

2.4.1.6 COR LEVEL - Two pushbuttons are provided to set the level at which the COR and SQUELCH circuits activate. The COR level is adjustable from noise level to approximately 40 dB above noise. When the COR level is exceeded, both the COR and AUDIO circuits activate. An LED, on the down button, lights when the level is exceeded. With "00" displayed in the COR window, the COR level is set to minimum and the COR circuit will be active at all times. A display of "--" indicates maximum level. keeping the COR circuit inactive at all signal levels. The COR Level also controls the activation of automatic frequency control when AFC is selected. This circuit prevents AFC from affecting the operation of the receiver until the signal level is above the set COR level. When AFC is selected, the COR Level should be increased until the COR LED extinguishes, with no signal present.

2.4.1.7 MEMORY SELECT - Two pushbuttons are provided to select the desired memory channel. Pressing the up button will count up through the memory channels while the down button will count down. Each memory channel stores all receiver information (COR LEVEL, RF/IF GAIN, AFC and AGC STATUS, ANTENNA. DETECT MODE, BANDWIDTH, OPTIONAL BFO FREQUENCY and TUNED FREQUENCY).

2.4.1.8 BFO (Optional) - Depressing this pushbutton permits offsetting of the 21.4 MHz BFO frequency when the Variable BFO Option is installed. When depressed, the BFO frequency can be varied ±1.99 kHz, using the tuning knob.

2.4.1.9 TUNING RATE - Depressing one of the three tuning rate pushbuttons will cause the tuned frequency to change in 1 MHz, 10 kHz or 100 Hz steps as the tuning knob is rotated.

2.4.1.10 TUNING KNOB - Rotation of this knob will change the receiver tuned frequency. The frequency will change at a rate determined by the tuning rate pushbuttons.

2.4.1.11 DISABLE - Depressing this button removes control of the tuned frequency by the tuning knob. The receiver will remain locked at the last selected frequency. Depressing any tuner related pushbutton will restore control to the tuning knob.

2.4.1.12 ANT 2 - This pushbutton selects the RF input from either the ANT 1 or ANT 2 input connector. When the ANT 2 pushbutton LED is illuminated, ANT 2 is selected. When the LED is extinguished, ANT 1 is selected.

2.4.1.13 STO - Depression of the STO pushbutton will transfer the selected receiver functions into the active memory channel. The TUNED FREQUENCY. AFC. AGC. RF/IF GAIN, COR LEVEL, BANDWIDTH, DETECT MODE, OPTIONAL BFO FREQUENCY and ANTENNA selections will be stored simultaneously into the channel displayed in the Memory Select window. After the data is stored, the Memory Select display is incremented to the next higher memory channel.

2.4.1.14 MAN - The MAN pushbutton permits the return to the manual mode of operation from the Scan, Step or Memory Recall modes. When returning from Recall. a single depression of the MAN pushbutton returns the receiver to the Manual mode. When returning from the SCAN or STEP mode, a single depression places the receiver into the SCAN or STEP CONTINUE modes respectively. A second depression places the receiver into the MANUAL operating mode.

2.4.1.15 REM - Permits switching, at the receiver, between the local and remote modes of operation. The REM pushbutton LED is illuminated when in the remote mode and extinguished when in the local mode. When switching between modes is performed by a remote controlling device, the REM pushbutton LED indicates the operating mode.

2.4.1.16 RCL - The RCL pushbutton recalls the receiver information stored in the active memory channel and displays the information on the front panel display and indicator lights. The display of the memory information does not affect the receiver operation. The receiver will remain locked to the previously selected functions and frequency.

2.4.1.17 EXC - Depressing the EXC button sets the receiver in accordance with the frequency and function selection stored in the active memory.

2.4.1.18 CLR - The CLR pushbutton activates a three step clear sequence that resets the receiver front panel and clears the memory. Depressing the CLR pushbutton one time initializes the clear sequence. The CLR LED illuminates, indicating that the clear sequence has been initialized, but the front panel and memory are not affected. This sequence can be aborted by depressing any front panel pushbutton, other than CLR. Depressing CLR a second time resets the front panel to: AGC ON, AFC OFF, BW #1. AM, MAN. COR-00, MEM-00, ANT 1, 20.000 MHz with tuning disabled. The clear sequence can be aborted at this time without clearing the memory by depressing any front panel pushbutton, other than CLR. Depressing the CLR pushbutton a third time completes the clear sequence. The memory is cleared and the CLR LED is extinguished.

2.4.1.19 SCAN - In the SCAN mode the receiver will search up to 8 operator programmed bands for signal activity greater than the programmed COR level. When signal activity is present, the receiver will stop until the signal falls below the COR level or the operator again depresses the SCAN button. With the inclusion of the Extended Memory option (EM), SCAN capabilities can be increased to 48 operator programmed frequency bands.

2.4.1.20 STEP - In the STEP mode, the receiver will step to the frequency set in each of the 16 memory channels. When signal activity greater than the programmed COR level is present, the receiver will stop until the signal falls below the COR level or the operator again depresses the step button. With the inclusion of the Extended Memory option (EM), STEP capabilities can be increased to 96 memory channels.

2.4.1.21 DWELL - The DWELL control sets the time period spent at each Scan increment or Step frequency in the SCAN or STEP modes. The DWELL is adjustable from approximately 1 msec (CCW) to 4 sec (CW).

2.4.1.22 AUDIO GAIN - The AUDIO GAIN control adjusts the level of the audio signal present at the phones jack. This level is adjustable from 0 to 10 mW.

2.4.1.23 LINE AUDIO - This rear panel control adjusts the level of the audio signal present at the rear panel audio output J3. The level of the signal is adjustable from 0 to 10 mW.

2.4.1.24 RF/IF GAIN - The RF/IF GAIN control provides manual control of the RF and IF amplifiers when AGC is not selected.

2.4.1.25 INTENSITY - The INTENSITY control varies the brightness of the trace on the CRT of the signal monitor.

2.4.1.26 FOCUS - The FOCUS control provides a means of obtaining a sharp trace on the CRT.

2.4.1.27 SWEEP RATE - The SWEEP RATE control is used to obtain optimum resolution at the sweep width being used and to prevent loss of sensitivity by sweeping too fast. The sweep rate is adjustable to 25 Hz.

2.4.1.28 SWEEP WIDTH - The SWEEP WIDTH control varies the width of the frequency spectrum being viewed. In a fully clockwise position, the maximum bandwidth is displayed. The sweep width is adjustable from 0-4 MHz.

2.4.1.29 CENTER FREQ - The CENTER FREQ control varies the horizontal position of the vertical pips on the CRT. Use this control to center the frequency spectrum under the center mark of the CRT.

2.4.1.30 GAIN - The GAIN control varies the height of the vertical pips displayed on the CRT. This control is adjusted to maintain the desired height of the display.

2.4.1.31 MARKER - In the ON position a 21.4 MHz marker is superimposed on the display as a reference marker. The marker frequency is locked to the receiver synthesizer.

2.4.1.32 LIN/LOG - The LIN/LOG switch provides a linear or logarithmic vertical deflection. The LIN position will provide a display with a vertical deflection proportional to the signal strength. In the LOG position, the vertical deflection is proportional to the log of the signal strength. This provides greater resolution of weaker signals in the log position.

2.4.1.33 DIGITAL DISPLAY - The DIGITAL DISPLAY is composed of seven-segment LED's. The display provides a digital read out. displaying the tuned frequency, COR level selected, relative signal strength, active memory channel and BFO offset frequency (when incorporated).

2.4.2 LOCAL OPERATION

2.4.2.1 Manual Control

The manual mode of operation permits total control of the receiver utilizing the front panel pushbuttons and control knobs. All operating parameters are selected utilizing the controls described in paragraph 2.4.1.

In addition to manually operating the receiver, the manual mode also permits the operator to program the receiver's 16 channel memory (96 channel memory with the EM, Extended Memory, option installed) and to enter into the Scan or Step modes of operation.

2.4.2.2 Memory Programming

The receiver's memory permits storage of receiver parameters such as COR level, RF/IF Gain, AFC and AGC status, ANTENNA, DETECTION MODE, IF BANDWIDTH and TUNED FREQUENCY. This stored data can be used to provide the desired receiver parameters during the SCAN or STEP modes of operation, or it can function as a scratch-pad memory in the manual mode to retain particular receiver settings. Programming of the memory is performed as follows:

Depress Memory Select Up/Down	Hold the Up or Down Memory Select pushbutton depressed until the number corresponding to the desired memory channel is displayed in the Memory Select window (00-15 standard; 00-95 optional).
Depress COR Up/Down	Hold up or down COR LEVEL pushbutton depressed until the number corresponding to the desired COR LEVEL is displayed in the COR window (00-40 or --).
Depress AFC	Changes status of AFC. AFC on - LED illuminated AFC off -LED extinguished
Depress AGC	Changes AGC status. Automatic Gain Control - LED illuminated Manual Gain Control - LED extinguished

Depress BW	Depress Bandwidth pushbutton corresponding to the desired IF Bandwidth. LED on the selected Bandwidth pushbutton illuminates.
Depress DETECT	Depress pushbutton corresponding to the desired Detection mode. AM, FM, CW, or Pulse detection standard, LOG and SSB optional. LED on selected Detection mode pushbutton illuminates.
Rotate Tuning Knob	Rotate the tuning knob CW or CCW until the desired frequency is displayed by the frequency display above the tuning knob. The tuning increments are determined by the 1 MHz. 10 kHz and 100 Hz Tuning Rate pushbuttons.
Depress ANT 2	Selects RF input from the standard Antenna 1 or Auxiliary Antenna 2. LED illuminated - Antenna 2 selected LED extinguished - Antenna 1 selected
Depress STO	Stores the selected receiver parameters into the memory channel displayed in the memory select window. Once the information is stored, the memory channel display is automatically incremented to the next higher channel.

Data stored in each memory channel can be recalled by depressing the RCL pushbutton. When RCL is depressed, the receiver parameters stored in the channel displayed in the memory select window will be displayed on the front panel indicators of the receiver. The receiver remains at the parameters set prior to the selection of RCL. Depression of the MAN pushbutton returns the indicators to that of the receiver setting or depression of EXC (EXECUTE) sets the receiver to the recalled data on the front panel.

2.4.2.3 SCAN Mode

In the SCAN Mode, the receiver will scan up to 8 operator programmed frequency bands utilizing the standard receiver memory. Up to 48 programmed frequency bands can be scanned when the receiver is equipped with the extended memory option (EM). All receiver

parameters and the start frequency of each scan are stored in the even numbered memory channels and the stop frequency is stored in the odd channels. Upon initiation of the Scan, the receiver will begin the scan at the frequency stored in the even numbered channel. setting the receiver to the parameters stored in that channel, and continue to the next higher odd numbered channel, containing the stop frequency. The scan is performed in discrete steps equal to approximately one-half the programmed IF bandwidth. The SCAN increments for the various IF bandwidths are listed in the Table of Scan Increments (Table 2-3).

Table 2-3. Table of Scan Increments

SELECTED IF BANDWIDTH	SCAN INCREMENT	SELECTED IF BANDWIDTH	SCAN INCREMENT
10 kHz, 20 kHz	10 kHz	300 kHz	150 kHz
50 kHz	20 kHz	500 kHz	250 kHz
75 kHz	30 kHz	1 MHz	500 kHz
100 kHz	50 kHz	2 MHz	1 MHz
250 kHz	120 kHz	4 MHz	2 MHz

If the COR LED is illuminated when the Scan is initiated. the receiver will wait 50 msec. before stepping to the next frequency increment, to permit the COR circuits to deactivate. After stepping to the new frequency, if the COR LED extinguishes comes back on, the receiver will lock on to the signal. Otherwise, the Scan will continue. When programming the COR level as one of the Scan parameters, it should be set at a level that will permit the LED to extinguish in the absence of signals, but cause the LED to illuminate when signal activity is present. Otherwise, the COR LED will remain on at all times and the receiver will not stop on a signal during the scan.

During the scan, if AFC is selected. the AFC LED will remain illuminated. When a signal is detected, and the COR LED illuminates, the AFC will adjust the receiver to center the signal within the IF bandwidth. IF AGC is selected, the AGC LED will extinguish and the receiver will operate at maximum gain during the scan. AGC will remain inactive until the operator selects the Scan Continue mode.

The type Scan sequence is determined by the channel number displayed in the memory select window. when the SCAN button is depressed. When an even number is displayed, the receiver will begin the scan at the even channel and continue to the next odd number in sequence. This single band will continue to be scanned until signal activity greater than the programmed COR level is detected or until the MAN pushbutton is depressed. If an odd number is displayed when the Scan is initiated. the scan will begin scanning at channel 00 and scan each band until it reaches the odd number that was present when the scan button was depressed. This multiple Scan sequence will continue until signal activitv greater than the programmed COR level is detected or the MAN pushbutton is depressed.

Prior to initiating the Scan function. the memory must be programmed. using the procedures described in paragraph 2.4.2.2. Using this procedure, enter the operating parameters and start frequency into the even channel and then step the memory select to the next higher odd channel. Enter the stop frequency (stop frequency must be greater than start frequency). Upon completion of memory programming, the Scan function can be initiated as follows:

Depress Memory Select Up/Down	Hold the Up or Down pushbutton depressed until the desired memory channel is displayed in the memory select window (n). This step will determine the type scan sequence that will be selected. n = odd number - Receiver will first scan from channels 00 to 01. Each succeeding band will be sequentially scanned up to and including the band comprised of channels n - 1 to n. n = even number - Receiver will scan a single band from channel n to n + 1.
Depress SCAN	Initiates the selected Scan sequence. Scan pushbutton LED illuminates and the front panel indicators reflect the programmed parameters for the active band. The frequency display displays the frequency of each increment of the Scan. If AGC has been selected as one of the programmed parameters, the AGC LED will be extinguished and the receiver will operate at maximum gain, during the Scan.
Rotate Dwell Knob	Controls the scan rate by controlling the time that the receiver dwells at each increment of the scan. Fully counterclockwise rotation selects minimum dwell time with the time increasing as the knob is rotated clockwise.

When a signal greater than the programmed COR level is encountered, the scan will stop and the COR pushbutton LED will illuminate. The receiver will remain at this frequency as long as the signal is present or until the scan button is again depressed to resume the scan sequence.

2.4.2.3.1 SCAN Continue

The Scan Continue function permits the interruption of the Scan sequence to allow manual control of the receiver. This mode permits an operator to manually optimize the detected signal and to reenter the scan sequence at the point where the interrupt took place. Entering into the Scan Continue mode from the Scan mode is performed as follows:

Depress MAN	Initiates the Scan Continue mode of operation. Scan pushbutton LED remains on and the MAN pushbutton LED illuminates. IF AFC was on during the Scan, it will be turned off and the AFC LED will extinguish. If AFC is still desired, it must be reselected by depressing the AFC pushbutton. IF AGC was selected as a scan parameter, it will be activated and the AGC LED will illuminate. The receiver gain will then be controlled by the AGC circuitry.
Operate Manual Controls	All front panel controls function as if in the manual mode of operation. Use controls to optimize response of detected signal. From this mode: a) the scan can be reentered at the point where the scan was interrupted, or b) the receiver can be placed into the manual mode of operation.
a) Reenter the Scan mode: Depress Scan	Returns the receiver to the Scan mode of operation. The MAN LED is entinguished and the SCAN LED remains illuminated. The scan is restarted at the point where it was interrupted by the Scan Continue function.

b) Enter Manual mode:	
Depress MAN	Places the receiver into the manual mode of operation from the Scan Continue mode. The MAN LED remains illuminated and the SCAN LED is extinguished.

2.4.2.3.2 Scan Lock-out (Optional)

Scan Lock-out is an optional function that is available when the Type 794137-3 Extended Memory option (EM) is incorporated in the receiver. This function permits the exclusion of selected signals from the scan to prevent the receiver from locking onto undesired signals. Lock-out data is stored in the higher order memory channels, in ascending order, according to frequency (channel 95 will store the highest lock-out frequency). The Scan mode, utilizing the Lock-out function, is described as follows:

Depress SCAN	Activates the Scan mode of operation. The SCAN LED is illuminated. The receiver will scan the programmed frequency bands until signal activity is encountered. When signal activity greater than the programmed COR level is encountered, the receiver will lock onto the signal.
Depress MAN	Places the receiver into the SCAN CONTINUE mode of operation. The SCAN and MAN LEDs are both illuminated. The receiver can now be operated manually to optimize the detected signal and the bandwidth can be changed to determine the bandwidth of the LOCK-OUT channel.
Depress LOCK-OUT	The frequency and bandwidth of the undesired signal is stored in the Lock-out memory. LOCK-OUT LED illuminates for 1 second. All signals within 1/2 of the IF bandwidth of the Lock-out frequency will be omitted from succeeding scans. If AFC has been selected, LOCK-OUT will occur after the signal is centered.

2.4.2.3.3 LOCK-OUT Channel Recall and Deletion

This mode permits the recall and display of the information stored in the lock-out channels. It also permits revision of lock-out memory by permitting the deletion of channels where lock-out is no longer desired. To activate the recall mode, the receiver must be in either the Scan Continue or Manual mode of operation. This operating mode is activated as follows:

Depress RCL	Initializes the Recall mode of operation. The RCL pushbutton LED is illuminated and the front panel displays reflect the information stored in the channel whose number is displayed in the MEMORY SELECT window.
Depress Memory Select Up/Down	Hold the MEMORY SELECT Up or Down pushbutton in until the number corresponding to the desired memory channel is displayed in the MEMORY SELECT window. When the displayed channel is a Lock-out channel, the letters "LL" will be displayed in the COR window.
Depress LOCK-OUT	Deletes the information stored in the Lock-out channel that is displayed in the memory SELECT window. The LOCK-OUT LED will illuminate for 1 second. When a channel is deleted, all lock-out channels below the deleted one will move up one location.
Depress MAN	Deactivates the Recall mode and activates the previously selected operating mode (MAN or SCAN CONTINUE).

2.4.2.4 STEP Mode

In the STEP mode, the receiver will step through up to 16 operator programmed memory channels in search of signal activity, utilizing the standard receiver memory. Up to 96 channels can be stepped through when the Type 794137-1 or Type 794137-3 Extended Memory is incorporated. Each memory channel is programmed with a complete set of receiver parameters using the memory programming procedure described in paragraph 2.4.2.2. RF frequencies need not be in ascending order as in the SCAN mode.

The number displayed in the memory select window (n) determines the highest channel that will be used in the step sequence. When the STEP pushbutton is depressed, the receiver will begin stepping all channels containing valid memory data. starting at channel 00 and continuing to channel n. This stepping sequence will continue until a signal greater than the programmed COR level is detected or until the MAN pushbutton is depressed.

If the COR LED is illuminated when the Step mode is initiated, the receiver will wait 50 msec. before stepping to the next memory channel to permit the COR circuits to deactivate. After 50 msec, if the COR LED is still on, the receiver will lock on to the signal. Otherwise, the receiver will step to the next memory channel.

Prior to initiating the Step mode, program the memory utilizing the procedure outlined in paragraph 2.4.2.2. The Step mode can then be initiated as follows:

Depress Memory Select Up/Down	Hold the Up or Down pushbutton depressed until the number corresponding to the highest desired memory channel is displayed in the Memory Select window. NOTE: The displayed number must be greater than 00.
Depress STEP	Initiates the STEP mode of operation. The STEP pushbutton LED illuminates and the front panel indicators reflect the programmed parameters in each memory channel as it is selected. The STEP sequence begins at channel 00 and sequentially steps to each channel.
Rotate Dwell Knob	Controls the time the receiver dwells at each channel in the STEP sequence. Fully counterclockwise rotation selects minimum dwell time with the time increasing as the knob is rotated clockwise.

When a signal greater than the COR level is encountered. the STEP sequence will stop and the COR pushbutton LED will illuminate. The receiver will remain at this frequency as long as the signal is present or until the STEP pushbutton is again depressed to resume the STEP sequence.

2.4.2.4.1 STEP CONTINUE

The STEP CONTINUE function permits the interruption of the STEP sequence to allow manual control of the receiver. This function permits an operator to manually optimize the detected signal and reenter the STEP sequence at the point where the interrupt took place. It also allows the operator to reprogram that memory channel if the signal is of no further interest. Entering into the STEP CONTINUE mode from the STEP mode is performed as follows:

Depress MAN	Initiates the STEP CONTINUE mode of operation. The STEP pushbutton LED remains on and the MAN LED illuminates. The front panel indicators reflect the data stored in the channel displayed in the memory select window.
Operate MANUAL Controls	All front panel controls function as in the Manual mode of operation. Use the controls to optimize the detected signal or to change parameters if the detected signal is of no interest.
Depress STO	Updates the displayed memory channel with the new or revised data. The STO pushbutton LED illuminates for 1 second when depressed.

From the STEP CONTINUE mode, the STEP mode can be reentered at the point where the STEP sequence was interrupted or the receiver can be placed into the Manual mode of operation.

a) Reenter the STEP mode:	
Depress STEP	Returns the receiver to the STEP mode of operation. The MAN pushbutton LED is extinguished and the STEP LED remains illuminated. The STEP sequence is restarted at the point where the interrupt took place.

b) Enter the MANUAL Mode:	
Depress MAN	Places the receiver into the Manual mode of operation. The MAN pushbutton remains illuminated and the STEP pushbutton LED extinguished.

2.4.2.5 Master/Slave Operation (Optional)

The Master/Slave function permits the control of up to 14 additional Master/Slave equipped receivers, utilizing the front panel controls of one of the receivers. Each receiver must be equipped with an IEEE-488 Interface. Switch #6 of the DIP switch on the IEEE-488 must be in the open position on each receiver and the remaining 5 switches are set to a binary number between 0 and 30 to designate the receiver address address 31 (11111) cannot be used as a valid address . Only one receiver can function as the master unit at a given time and the remaining receivers function as slave units when addressed.

Depress Memory Select Up/Down	Hold Memory Select Up or Down pushbutton depressed until the number corresponding to the address of the desired slave receiver appears in the Memory Select window of the Master receiver. If more than one receiver is designated with the displayed address, each receiver will respond to the Master commands.
Depress M/S	Activates the Master/Slave mode of operation and places the addressed receiver(s) in the Slave mode. The LED on the M/S pushbutton illuminates on the master unit and the remote pushbutton LED illuminates on the addressed slave unit(s). All front panel controls on the slave unit(s) are disabled except for the remote* pushbutton. All master unit controls function normally and control both the master and addressed slave units.

Depress M/S	When in the Master/Slave mode, depression of the M/S pushbutton deactivates the Master/Slave mode. The M/S pushbutton LED is extinguished.

* At the slave unit, depression of the RMT pushbutton removes the unit from control by the master and restores local control.

2.4.2.6 CURSOR (Optional)

Cursor is an optional mode of operation that is available when the Type 794137-2 (or Type 794137-3) Extended Memory. Type 794122 Digital Refreshed Display and an active Function (F↑) pushbutton are installed. In this mode, a portion of the RF spectrum can be scanned with a signal strength vs. frequency display of the scanned frequencies displayed on the signal monitor of the receiver. The tuning knob can then be rotated to position a cursor over any of the signal PIPS displayed on the signal monitor. When the cursor is positioned over the signal pip, the frequency of that signal is displayed in the frequency window of the digital display.

Prior to entering into the Cursor mode, the memory must be programmed. using the procedure described in paragraph 2.4.2.2. Store the start frequency and operating parameters into the even numbered channels and the stop frequency in the odd channels. Upon completion of the memory programming, the cursor mode may be entered into, as follows:

Depress F↑	Selects the uppercase function. All pushbutton LED's will extinguish.
Depress Cursor (Scan pushbutton)	Selects the Cursor mode of operation. The pushbutton LEDs on the front panel will again illuminate.
Depress Cursor (Scan pushbutton) a second time	Activates the Cursor Scan. The receiver will perform a single scan of the programmed band and stop. Upon completion of the Scan, the receiver will enter into the Cursor/Manual mode of operation.

Operate the Tuning Rate push-button	Select the desired tuning rate by depressing the 1 MHz, 10 kHz or 100 Hz pushbutton and rotate the tuning knob until the cursor is positioned over the desired signal pip on the signal monitor. The frequency display on the digital display indicates the frequency at which the cursor is positioned. Note: The cursor travel is not limited to the frequency band displayed on the signal monitor. Therefore, if the cursor does not appear on the signal monitor, rotate the tuning knob until the displayed frequency is within the scanned frequency band.

To disable the Cursor mode, and return the receiver to normal operation, proceed as follows:

Depress F↑	The Cursor (Scan) pushbutton LED will illuminate and all other LED's will extinguish.
Depress Cursor (Scan)	The Cursor (Scan) LED will extinguish and the selected pushbutton LED's will again illuminate. The receiver will then be restored to normal operation.

2.4.2.7 ERROR CODES

If an error condition should occur, the word "Error" along with a three digit error code will be momentarily displayed in place of the frequency display. The error codes associated with the various operating modes are as follows:

Error 501	This code will be displayed if all lock-out channels are in use and the creation of an additional one is attempted. To increase Lock-Out memory space, depress RCL and step to a channel number below the lowest existing lock-out channel. Depress LOCK-OUT. The displayed channel and all higher channel numbers will now be available for lock-out.

Error 502	This code will be displayed if an attempt is made to store data, other than LOCK-OUT data into a channel designated for LOCK-OUT.
Error 800	This code will be displayed if SCAN is initiated when the memory is programmed with the start frequency greater than the stop frequency. The memory must be programmed with the even numbered channel containing the lower frequency with the frequencies in ascending order.
Error 810	This code will be displayed if an attempt is made to initiate the STEP or SCAN mode when no valid data is stored in the memory locations to be scanned or stepped. The memory must be programmed as described in paragraph 2.4.2.2.
Error 811	This code will be displayed if an attempt is made to initiate the STEP mode when 00 is displayed in the Memory Select window. Depress the Memory Select UP pushbutton to select a channel greater than 00.

2.5 PREPARATION FOR RESHIPMENT

If the unit must be prepared for reshipment, the packaging methods should follow the pattern established in the original shipment. If retained, the original materials can be reused to a large extent or will at minimum provide guidance for the repackaging effort.

WJ-8610 SERIES REMOTE INTERFACE OPERATION

March 1981

WJ-8610 SERIES REMOTE INTERFACE OPERATION

With the inclusion of the IEEE-488 or RS-232 Remote Interface, the WJ-8610 Series Receiver can be fully controlled using an external controlling device. The controller transmits one or more data bytes, in the form of a message, to the receiver. This message consists of a mnemonic (or binary code) representing a command or request by the controller. When the command is to set one of the receiver parameters to a specified value, it is followed by a decimal number (n or f) representing that value.

The IEEE-488 digital interface is specified as a general purpose interface for programmable instrumentation. This standard anticipates that each design using this interface will only implement a subset of the capabilities. It systematizes these subsets and introduces nomenclature for their specification. Capabilities of the IEEE interface as implemented in the WJ-8610 Series Receiver include:

SH1	source handshake
AH1	acceptor handshake
T6	basic talker with serial poll
L3	basic listener with listen only poll
SR1	service request

Essentially, this means that the receiver can talk or listen when commanded by the controller and it can issue a service request to notify the controller when it needs service. To be compatible, the controller should have the following capabilities:

C1, C2, C4, C27 AH1, SH1, T3, L1	System controller - single controller system

Up to fourteen 488 equipped receivers can interface with a single controller, with the controller being able to communicate with each receiver individually. Data is transferred between units in a bit-parallel, byte-serial form. Sixteen interconnection lines are utilized, consisting of eight bi-directional data bus lines, three data byte transfer lines, and five interface management lines. The data bus lines transfer data or address information between devices. The data byte transfer lines indicate the availability and validity of the information on the data bus lines, whether or not the devices are ready to accept data, and whether or not the data has been accepted. The interface management lines specify whether the data bus lines

are carrying data or address information, request service requests, and clear the interface and indicate the end of a transfer sequence.

A six-position DIP switch, located on the interface board, sets the binary address code for the receiver. Switch positions 1 through 5 permit address settings of from 0-31, with position 1 being the least significant bit. Position 6 enables Master/Slave (with Master/Slave incorporated). The closed positions of the switch represent a logic "0" and the open positions represent a logic "1."

All IEEE-488 Interfaces are shipped with the address preset to "6."

The RS-232 standard specifies a serial data transfer format and several control lines for interface between a DATA MODEM and a DATA SET. It is, however, commonly used to transfer data between other types of devices.

As implemented in the WJ-8610 Series Receiver, the network consists of one controller and one remote receiver. Data is transferred between the controller and receiver, in serial form, via two one-way data lines. The TX Data line transfers data from the receiver to the controller and the RX Data line transfers data to the receiver from the controller. In addition to the two data lines, associated bus control handshake lines may be used to control the data flow between the units. These lines include:

RTS	Request to Send
CTS	Clear to Send
DCD	Data Carrier Detect

Each transmitted message consists of one or more message bytes, followed by a hexadecimal "FF" to indicate the end of the message (ASCII messages may also be terminated by "LF," "CR-LF" or ";"). Each transmitted byte consists of eight data bits, an odd parity bit and a stop bit.

The data signaling rate is selectable at rates of 300, 600, 1200, 2400, 4800 or 9600 baud. A six-position DIP switch, located on the RS-232, permits the selection of the signaling rate to match that of the controller. Placing one of the switches to the closed position selects its corresponding baud rate. (All but the desired rate switches must be in the open position.)

Both the RS-232 and the IEEE-488 are byte oriented interfaces. One or more data bytes may be sent, in either ASCII or Binary format, to form a message. In the ASCII format, each data byte is an ASCII character. The message consists of a mnemonic followed optionally by a decimal number (spaces are ignored). These messages may be directly printed or displayed where the operator can readily identify the mnemonic with its corresponding function. The Binary format is used where speed is an important consideration. Only about one-fourth as many bytes are needed in this format as in ASCII and the receiver can decode the Binary messages more rapidly. The Table of Mnemonics and Binary Codes (Table I) lists the usable mnemonics and corresponding binary codes (in hexadecimal), along with a brief explanation of their function. Included in this list are codes that are unique to optional subassemblies and apply only when the option is installed in the receiver.

Table I. Mnemonics and Binary Codes

NOTE: The mnemonics in parentheses are the possible receiver responses for that function.

Mnemonic	Hexadecimal	Function
AFC	42	Turn on AFC function
AFC/	43	Turn off AFC
AFC?	44	What is state of AFC? (AFC or AFC/)
AGC	45	Turn on AGC
AGC/	46	Turn off AGC
AGC?	47	What is state of AGC? (AGC or AGC/)
AM	48	Set AM detection mode
AM?	4A	What is value of AM video? (AM n) 000-068 Range
ANT n	4B	Select antenna n
ANT?	4D	Which antenna is selected? (ANT n)
BIN	54	Set binary remote interface mode
BIN/	55	Set ASCII remote interface mode
BFO f	39	Set BFO frequency
BFO?	3B	What is BFO frequency? (BFO f)
BW n	4E	Set bandwidth number n
BW?	50	What bandwidth number is selected? (BW n) 1-5
BWC?	9C	What is bandwidth? (in kHz)
CLR	51	Perform the clear function
CLM	6C	Clear memory
COR n	57	Set the COR level: 0 minimum, 40 maximum
COR?	59	What is the COR level? (COR n)
CST?	99	What is COR status?
CW	5A	Set the CW detection mode
DET?	5F	Which detection mode is selected? (AM, FM, CW, PLS, USB, LSB)
DWL n	60	Set dwell value: 0 minimum, 255 maximum
DWL?	62	What is the dwell value? (DWL n)

Table I. Mnemonics and Binary Codes (Cont'd)

Mnemonic	Hexadecimal	Function
ERR?	65	What is the error number? (ERR n)
EXC	66	Perform the execute function
FM	69	Set FM detection mode
FM?	6B	What is the value of the FM modulation? (FM n) 000-100 range. Reads directly in % of modulation
FRQ f	3C	Set the RF frequency
FRQ?	3E	What is the frequency? (FRQ f)
INT	6C	Allow SRQ interrupts on remote interface (IEEE-488 only)
INT/	6D	Don't allow SRQ interrupts
INT?	6E	Are SRQ interrupts allowed? (INT or INT/)
LCK	94	Lockout
LGV?	71	What is the log video value? (LGV n) 000-085 range
LOG	96	Set LOG detection mode
LSB	72	Select the lower sideband SSB detection mode
MAN	75	Perform the manual function
PLS	78	Select the pulse detection mode
RCL n	7B	Recall memory channel n
RFG n	7E	Set the RF gain: 0 minimum, 255 maximum
RFG?	80	What is the RF gain? (RFG n) 0-255 range
RMT	81	Put the receiver in remote mode
RMT/	82	Put the receiver in local mode
RMT?	83	Is the receiver in remote mode? (RMT or RMT/)
SCN n	84	Put receiver in scan mode n = channel number
SS?	89	What is signal strength? (SS n)
STO n	8A	Perform a store n = channel number
STP n	8D	Put receiver in step mode n = channel number
STS n	90	Set status bit
STS?	92	What is the receiver status?
USB	93	Select the upper sideband SSB detection mode

In Table I, n represents a decimal number in the range of from 0 to 255. When the ASCII format is used, each digit is represented by a separate ASCII character. In the binary format the value of n is sent as a one byte binary word. For the FRQ function. f represents the frequency in MHz. Using the ASCII format, each digit and the decimal are represented by a separate ASCII character (i.e., 1034.5678). Leading and trailing zeros may be omitted. If the decimal is omitted, it is assumed to be to the right of the last digit. Using the Binary format, the value of f is sent as eight BCD digits packed into four bytes (i.e., 10 34 56 78).

For the BFO function, f represents the offset frequency of ±1.99 kHz. Using the ASCII format, an ASCII character is used to represent each digit and the decimal in the offset frequency. Negative frequency is sent 9's complement (trailing zeros may be omitted). In the

Binary format, f is sent in the same manner as the FRQ function, with negative frequency sent in 9's complement.

For the DWL function, n represents a value of from 0 to 255 which is used by the receiver to detemine the dwell time at each frequency step during the Scan and Step modes of operation. A value of n = 0 would represent the shortest dwell period (approximately 750 µsec) while a value of n = 255 would represent a dwell period of approximately 4 seconds. The Table of Minimum Dwell Time (Table II, page 6) provides an aid to determine the dwell period in microseconds for the various values of n (dwell number). Each time unit in the table is equal to 250 microseconds.

The response to an AM? mnemonic is a number from 000 to 068 which represents the level of AM Video present at the output of the receiver. Each digit represents approximately 13 mVrms of AM video. For FM?, the response is a number ranging from 000 to 100, which represents the precentage of FM modulation. Each digit represents a 1 percent increment with 100 being equal to 100% modulation and 000 equal to no modulation.

LGV? provides a number from 000 to 085, which represents the Log video level of the receiver. This number represents the signal level above the noise floor, of the receiver, with each number representing a .47 db change. The noise floor is represented by 000, with 085 representing 40 db above noise.

To set the COR level, a COR n function would be used. With this function, n represents a decimal number from 0 to 40. This number corresponds to a threshold setting from noise level (0) to approximately 40 dB above noise (40). Each interim step is equivalent to approximately a 1 dB change.

For the RFG n function, n represents a gain control number of from 0 to 255. This function provides a minimum of 80 dB of range, with 0 representing minimum gain and 255 representing maximum gain. The effect of the gain control number on gain is illustrated in the Gain Reduction Versus Control Number Graph (Figure 1, page 7). The curve shows an average of 0.5 dB per bit at a tuned frequency of 255 MHz. It should be noted that there will be a variation from this typical curve over the tuning range of the receiver. If precise accuracy is required, a separate table of control number versus gain reduction should be compiled at several

Table II. Minimum Dwell Time

Dwell Number	Time Units			Min. Dwell Time msec	Average Time msec
0 - 55			3	.75	1.50
56 - 63			4	1.00	1.75
64 - 67			5	1.25	2.00
68 - 71			6	1.50	2.25
72 - 75			7	1.75	2.50
76 - 79			8	2.00	2.75
80 - 81			9	2.25	3.00
82 - 83			10	2.50	3.25
84 - 85			11	2.75	3.50
86 - 87			12	3.00	3.75
88 - 89			13	3.25	4.00
90 - 91			14	3.50	4.25
92 - 93			15	3.75	4.50
94 - 95			16	4.00	4.75
96 - 111	(Dwell number - 96) x 1 + 17	96 =	17	4.25	5.00
		111 =	32	8.00	8.75
112 - 127	(Dwell number - 112) x 2 + 33	112 =	33	8.25	9.00
		127 =	63	15.75	16.50
128 - 143	(Dwell number - 128) x 4 + 65	128 =	65	16.25	17.00
		143 =	125	31.25	32.00
144 - 159	(Dwell number - 144) x 8 + 129	144 =	129	32.25	33.00
		159 =	249	62.25	63.00
160 - 175	(Dwell number - 160) x 16 + 257	160 =	257	64.25	65.00
		175 =	497	124.25	125.00
176 - 191	(Dwell number - 176) x 32 + 513	176 =	513	128.25	129.00
		191 =	993	248.25	249.00
192 - 207	(Dwell number - 192) x 64 + 1025	192 =	1025	256.25	257.00
		207 =	1985	496.25	497.00
208 - 223	(Dwell number - 208) x 128 + 2049	208 =	2049	512.25	513.00
		223 =	3969	992.25	993.00
224 - 239	(Dwell number - 224) x 256 + 4097	224 =	4097	1024.25	1025.00
		239 =	7937	1984.25	1985.00
240 - 255	(Dwell number - 240) x 512 + 8193	240 =	8193	2048.25	2049.00
		255 =	15873	3968.25	3969.00

NOTES

1. Dwell is input from dwell pot or dwell message as a number from 0 to 255.
2. Time units equal 250 μsec.
3. Average dwell time is approximately equal to Minimum Dwell Time + 750 μsec.

frequencies throughout the frequency range of the receiver. This should be done for each receiver.

To initiate the SCN n function, the receiver operating parameters, start frequencies and stop frequencies are sent to the receiver and stored in the appropriate memory channels using the commands illustrated in Table I. All operating parameters and the start frequency of each scan are stored in the even numbered memory channels and the stop frequencies are stored in the odd channels. The scan function is initiated with a SCN n command. When n is an even number, a single band is continuously scanned, beginning with channel n and ending at channel n + 1. When n is an odd number, all programmed bands are scanned, beginning with channel 0 and continuing to channel n. The receiver parameters for each scan band are taken from the even channels and the stop frequency is taken from the odd channels.

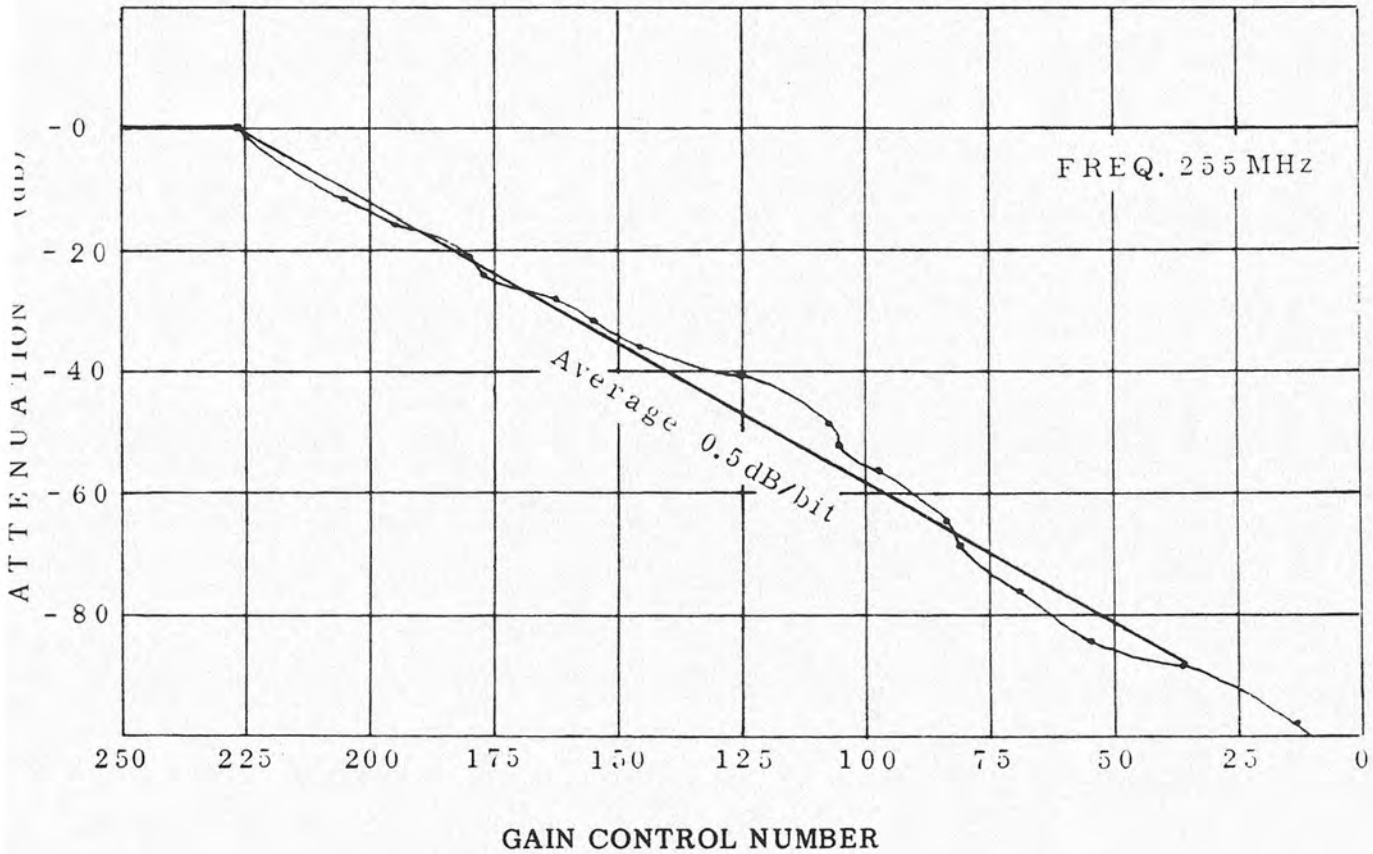

Figure 1. Gain Reduction Versus Control Number

The following is a typical example of the SCN function:

FRQ 20; BW 1; COR 5; DWL 100; AM; STO 0; FRQ 30; STO 1 (CR) (LF)

FRQ 31; BW 2; COR 4; DWL 100; FM; STO 2; FRQ 40; STO 3 (CR) (LF)

SCN 3 (CR) (LF)

The receiver will scan from 20 MHz to 30 MHz using the parameters stored in channel 0. It will then scan from 31 MHz to 40 MHz using the parameters stored in channel 2. The scan will continue until a signal is encountered or a MAN command is sent to the receiver.

SCN 2 (CR) (LF)

The receiver will scan from 31 MHz to 40 MHz using the parameters stored in channel 2. The receiver will continue scanning between channels 2 and 3 until a signal is encountered or a MAN command is sent.

The STP n function is similar to the SCN n except that each memory channel contains a complete set of receiver parameters and the receiver tunes to the discrete frequency stored in each channel. When a STP n is sent, the receiver will step to each channel containing valid memory information starting with channel 0 and continuing to channel n. This stepping sequence will continue until a signal is encountered or a MAN function is sent.

If a scanning (or stepping) receiver encounters a signal, a Service Request (IEEE-488) or a Signal Acquisition Message (RS-232) will be sent. The Signal Acquisition Message is two bytes (FE, FF hex). The controller can then be queried as to the characteristics of the encountered signal. Upon completion of the query, the receiver can be commanded to continue the scan with a SCN command or it can be placed in the manual mode using a MAN command.

The following are typical ASCII messages:

AGC/ cr lf	turn AGC function off
ANT 2 cr lf	select antenna 2
FRQ 12. 34 cr lf	set frequency to 12. 34 MHz

The corresponding messages in binary would be as follows:

46
4B 02
3C 00 12 34 00

In ASCII format the message is usually ended with a line feed (lf). The carriage return (cr) is optional. When the IEEE interface is used, the message may be ended by asserting the EOI control line with the last data byte. The binary format messages are always ended this way. When the RS-232 interface is used, binary messages are always ended with an EMS control byte (hexadecimal FF). ASCII messages may also be ended this way. For either interface, to facilitate sending several ASCII messages, these messages may be ended with a semicolon.

Many messages are queries and call for a reply from the receiver. With the IEEE interface, after such a message is sent the controller must address the receiver to talk. After sending the message the controller can talk to other receivers; however, another message should not be sent to that receiver until the reply from the last message is received. The RS-232 interface has separate send and receive circuits for each receiver. However, each message requires a response and a new message must not be sent until the response is received.

If the message was a query, the response is the reply to the query followed by EMS (FF hex). Otherwise the response is FD, FF hex. A complete ASCII sequence for a controller sending a message and receiving a response is given below. The items in parentheses are received by the controller. Control and special characters are in lower case. Underlined characters are IEEE-488 control bytes.

lad ANT 2; AGC? cr lf tad (AGC/ cr lf) unt

If a receiver encounters an error condition, a Service Request (IEEE-488) or an Error Message (RS-232) will be sent. The Error Message is FC, FF hex. The error codes are as follows:

Remote Errors

401 Buffer full (message too long)
402 Less than 2 characters in message
403 RS-232 - Framing, parity or overrun error
404 Invalid number
406 "/" or "?" not valid for this mnemonic
407 Invalid message

Scan/Step Errors

800 Start Freq > Stop Freq
810 No valid memory channels
811 Illegal to step with memory channel = 0

Lock Out

501 No room for lockout channel
502 Attempt to store into lockout channel

A status byte is available as a reply to an STS? query or as a response to a serial poll. The response is a 3 digit number, from 000 to 127, representing the binary value contained in the status byte.

The bits in the status byte have the following significance:

Bit	0	= 1	if a signal is present or when the remote interface is first initialized (cleared by STS?).
	1		is set to 1 by an STS 2 command to activate RFG with AGC on.
	2		
	3		
	4	= 1	when processing or responding to an interface message
	5	= 1	if error (cleared by ERR?)
	6	= 1	if SRQ was sent
	7	not used	

000 = 00000000; 127 = 01111111

Below are some response times for ASCII messages. Similar times may be expected for similar messages. For binary mode the times will be about one-fourth those listed. These times are only for the receiver and do not include any processing by the controller. In addition the latent period between commands is .5 msec. If the receiver is in scan or step mode when the message is received, these times will be significantly longer.

AFC	1.0 msec
AFC?	2.3 msec (including response)
COR 40	2.5 msec
COR?	3.8 msec (including response)
FRQ 1234.5678	5.7 msec
FRQ?	6.8 msec (including response)

After a power fail condition, the system must be reinitialized. The receiver will come up in the ASCII format. If the binary format is required, a BIN command will set the binary remote mode. Returning the receiver to the local mode of operation is accomplished using the RMT/command.

SECTION III

REPLACEMENT PARTS LIST

3.1 UNIT NUMBERING METHOD

The unit numbering method of assigning reference designations (electrical symbol numbers) has been used to identify assemblies, subassemblies (and modules) and parts. An example of the unit numbering method follows:

Subassembly Designation A1	R1 Class and No. of Item
Identify from right to left as:	First (1) resistor (R) of first (1) subassembly (A)

As shown on the main chassis schematic, components which are an integral part of the main chassis have no subassembly designation.

3.2 REFERENCE DESIGNATION PREFIX

Partial reference designations have been used on the equipment and on the illustrations in this manual. The partial reference designations consist of the class letter(s) and identifying item number. The complete reference designations may be obtained by placing the proper prefix before the partial reference designations. Reference Designation Prefixes are provided on drawings and illustrations in parentheses within the figure titles.

3.3 LIST OF MANUFACTURERS

Mfr. Code	Name and Address
00629	Eby Sales Company, Inc. 148-05 Archer Avenue Jamaica, NY 11435

3.4 PARTS LIST

The parts list which follows contains all electrical parts used in the equipment and certain mechanical parts which are subject to unusual wear or damage. When ordering replacement parts from the Watkins-Johnson Company, specify the type and serial number of the equipment and the reference designation and description of each part ordered. The list of manufacturers provided in paragraph 3.3 and the manufacturer's part number for components are included as a guide to the user of the equipment in the field. These parts may not necessarily agree with the parts installed in the equipment; however, the parts specified in this list will provide satisfactory operation of the equipment. Replacement parts may be obtained from any manufacturer as long as the physical and electrical parameters of the part selected agree with the original indicated part. In the case of components defined by a military or industrial specification, a vendor which can provide the necessary component is suggested as a convenience to the user.

NOTE

As improved semi-conductors become available, it is the policy of Watkins-Johnson to incorporate them in proprietary products. For this reason some transistors, diodes and integrated circuits installed in the equipment may not agree with those specified in the parts lists and schematic diagrams of this manual. However, the semiconductors designated in the manual may be substituted in every case with satisfactory results.

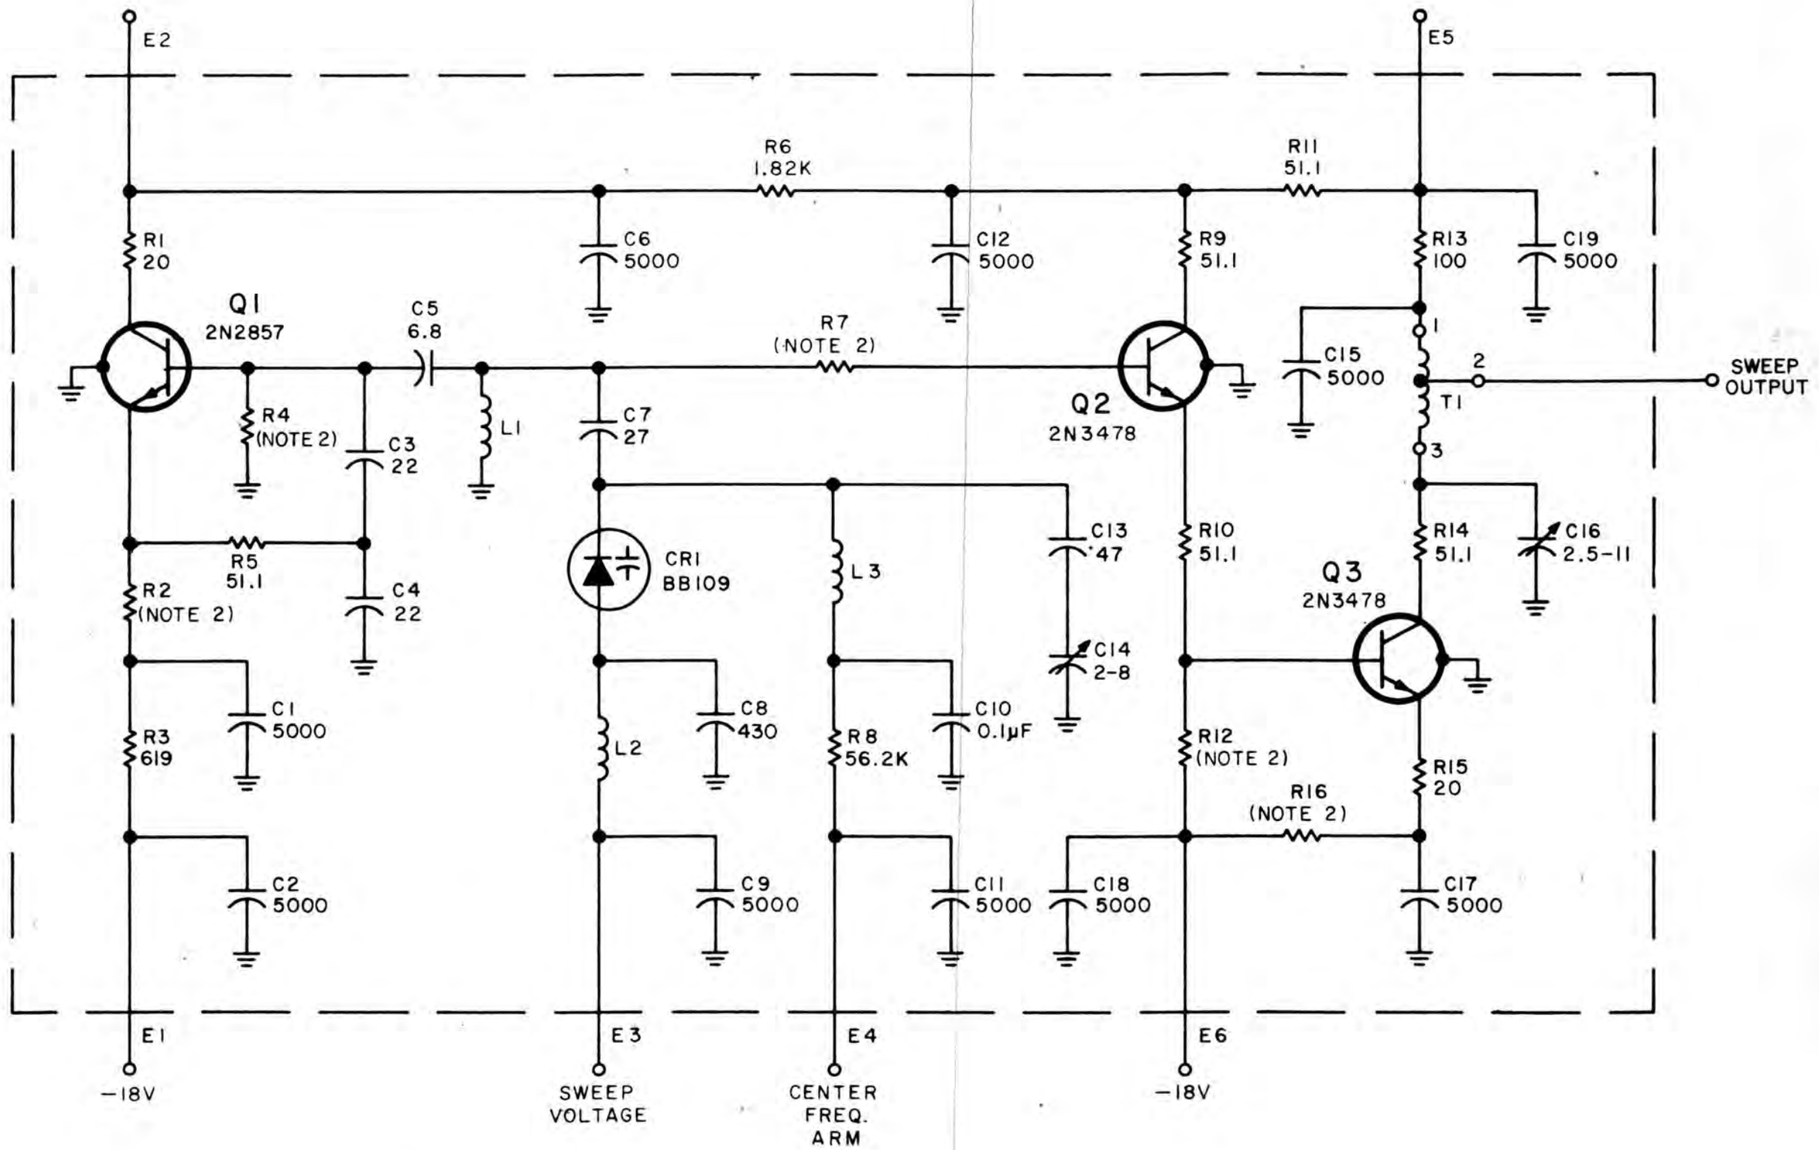

Figure 4-8 Part 15799-3 Sweep Oscillator (A2A3A1) Schematic Diagram 32369

NOTES:
1. UNLESS OTHERWISE SPECIFIED, RESISTANCE IS IN OHMS, ± 5%, 1/4W.
2. CW AT POTENTIOMETERS INDICATES FULL CLOCKWISE POSITION OF ACTUATOR.
3. ▭ INDICATES FRONT PANEL CONTROL.

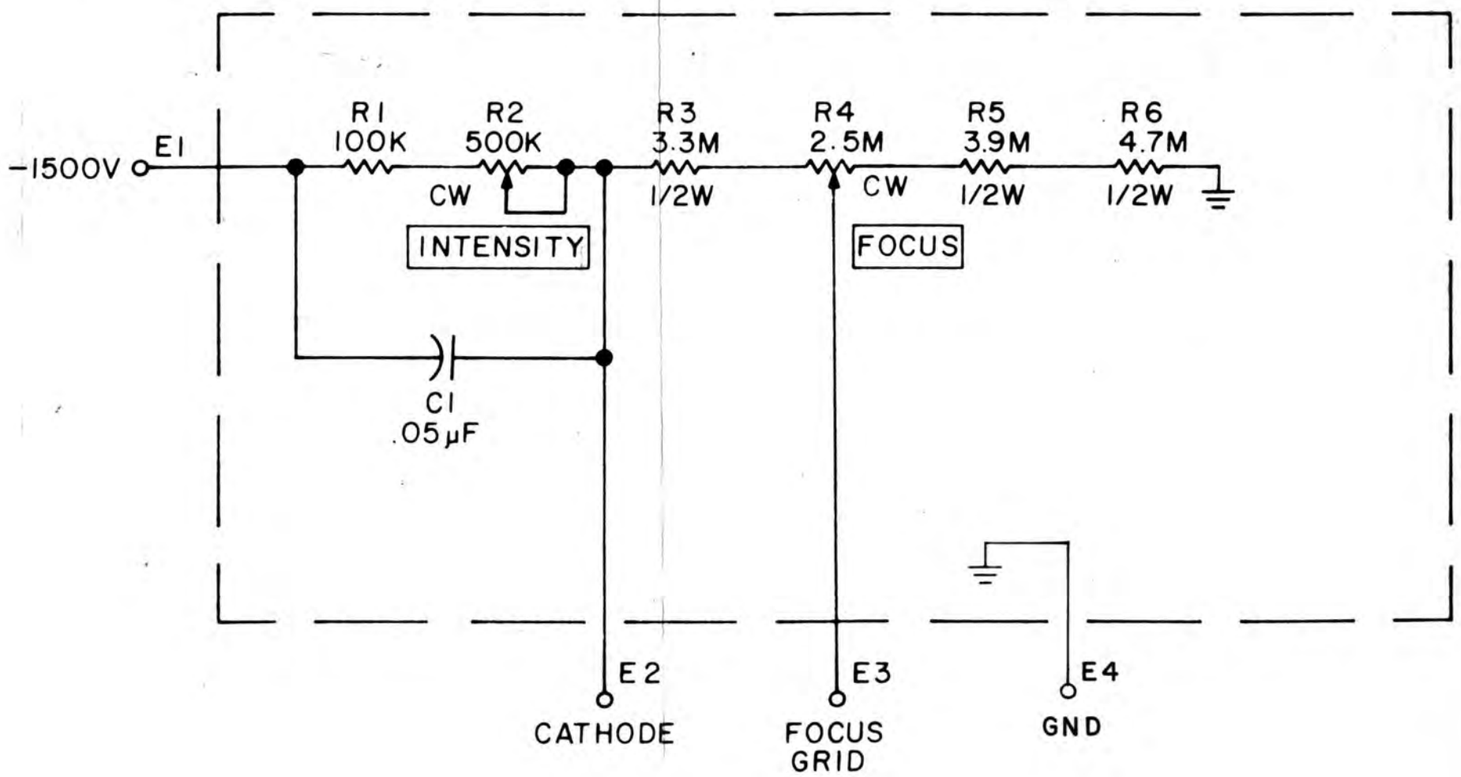

Figure 4-9. Type 794099 Focus & Intensity Control (A2A4) Schematic Diagram 270343.

NOTES:

1. UNLESS OTHERWISE SPECIFIED:
   (a) RESISTANCE IS IN OHMS, 1/4W, 5%.
   (b) CAPACITANCE IS IN μF.
2. ENCIRCLED NUMBERS ARE MODULE PIN NUMBERS.
3. DIFFERENE BETWEEN TYPES IS MECHANICAL ONLY.

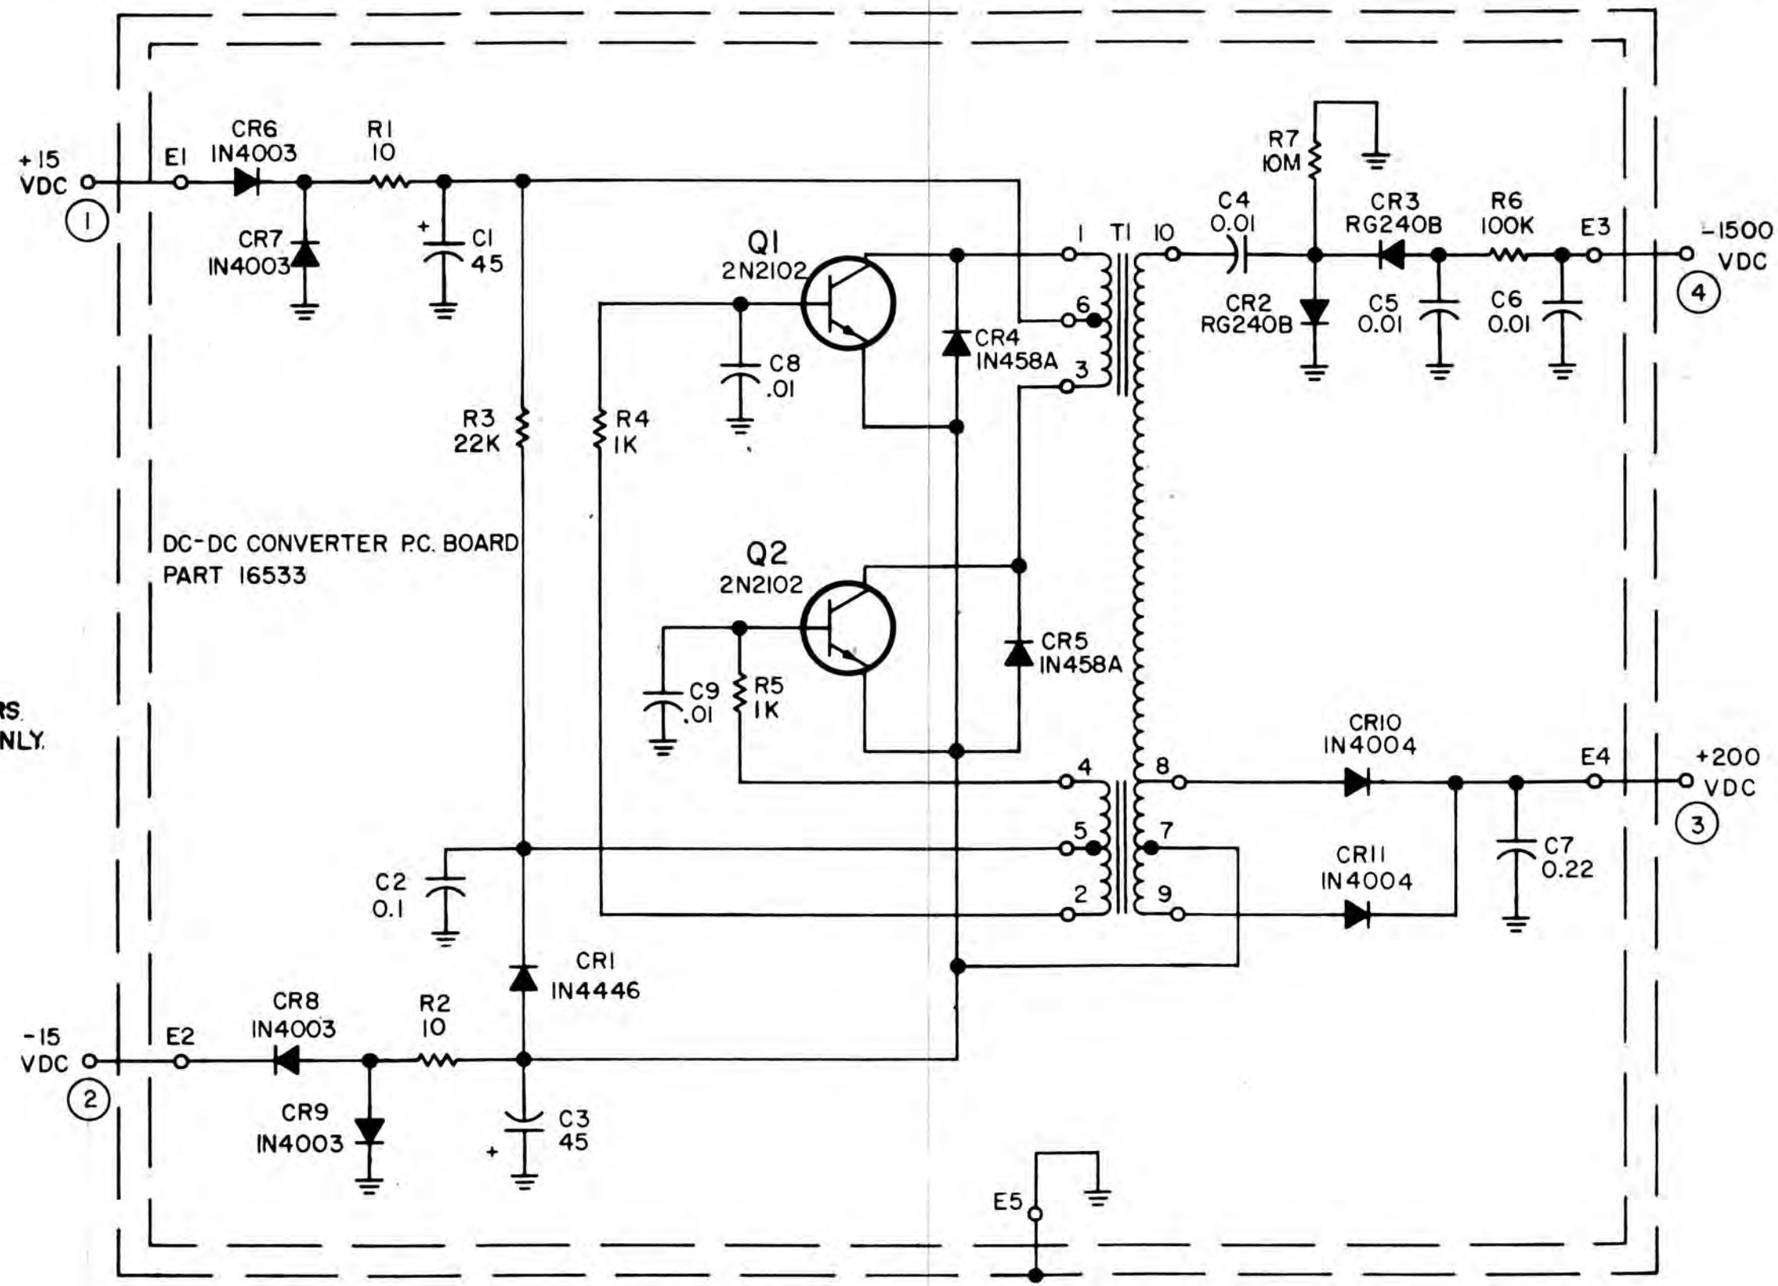

Figure 4-10 Type 764006 DC-DC Converter (A2A5) Schematic Diagram 32874

NOTES:
1. UNLESS OTHERWISE SPECIFIED:
   a) RESISTANCE IS IN OHMS, ±5%, 1/4W.
   b) CAPACITANCE IS IN pF.
2. ONLY PINS USED BY EACH MODULE ARE SHOWN. SOME OTHER PINS OF XA15-XA18 HAVE SIGNALS CONNECTED, FOR MOTHER BD PRINTED WIRING PURPOSES. THIS ALSO PERTAINS TO XA6 & XA8.
3. (S) INDICATES, THAT PIN IS USED FOR COAX SHIELD.
4. POSITIONS A19(XA19) AND A20(XA20), NOT SHOWN, ARE SPARE POSITIONS FOR RECEIVER OPTIONS.
5. FREQUENCY EXTENDER 861XA/FE-2 IS STANDARD ON THE WJ-8617A & WJ-8618A RCVRS, OPTIONAL ON THE WJ-8616A RCVR.
6. DASHED LINE SHOWS 20-500MHz INPUT CONNECTION WHEN 861XA/FE-2 IS NOT IMPLEMENTED.
7. COAX CONNECTIONS BETWEEN PC CONNECTIONS ARE WIRE WRAPPED.

APPENDIX A

FE-2 500 - 1,100 MHZ FREQUENCY EXTENDER, TYPE 794111-1 & TYPE 794114-1

The UHF Frequency Extender option (FE-2) is available for the WJ-8616A receiver to include coverage of the 500 - 1100 MHZ UHF frequencies in its frequency range. This option consists of a UHF Preselector type 794111-1 and a UHF Preamplifier/Mixer/LO type 794114-1.

The UHF Preselector covers the 500 - 1,100 MHZ frequency range in three bands which are automatically selected by the receiver circuitry in accordance with the tuned frequency. Control voltages, from the receiver control circuitry, control the switching of three pin diode switching networks at the input and output of the preselector to accomplish band selection.

The UHF Preamplifier/Mixer/LO provides amplification of the UHF signal from the preselector and mixes the signal with the LO signal from the UHF synthesizer to obtain an output signal in the VHF range. This signal is then processed as VHF by the receiver. A second RF input to the UHF Preamplifier/Mixer/LO accepts the VHF input. This provides a signal path for the VHF signal to the VHF high band preselector when tuned within the VHF range and is isolated during UHF operation.

Installation of the FE-2 option can be accomplished by plugging the type 794111-1 UHF Preselector and the type 794114-1 UHF Preamplifier/Mixer/LO printed circuit cards into existing connectors on the RF/IF motherboard (connectors A3A1 and A3A2). The connectors

provide power and control inputs. In addition, the following coaxial cable connections must be completed as follows:

1. Connect cable A1W1 of the UHF Preselector (A3A1) to A8J4.
2. Connect cable A1W2 to J1 of the UHF Preamplifier/Mixer/LO (A3A2).
3. Connect J2 of A3A2 to A8J3.
4. Connect A3A2A1J1 to the 1 MHz reference output of A4A1.
5. Connect cable W1 from A3A2J4 to connector J3 of A3A3.

APPENDIX B

ANS ANTENNA SWITCH, TYPE 794128-1

The Antenna Switch option provides the capability of selecting an RF input to the WJ-8610 Series receiver from either of two RF sources. This versatile input circuitry permits antenna input configurations such as antennas of different frequency ranges or locations. The antenna switch may be controlled manually via the antenna select pushbuttons, located on the front panel or by the firmware during the automatic modes of operation.

The ANS option consists of a switch driver and an RF switch contained in a single module. Refer to Figure B-1 for the type 794128-1 antenna switch. Control voltages are provided to the switch driver from the receiver control circuitry via P1. The switch driver, in turn, provides switching voltages to four pin diode switching networks on the RF switch board to select the proper antenna input and route the signal to the desired output.

Installation of the ANS option consists of mounting the module to the receiver with the A NT 1 and A NT 2 N-type connectors extending through a cutout in the rear panel. Three machine screws hold the module in place. The RF cables to the preselectors connect to SMC connectors J3 and J4. Plug P1 connects to the optional antenna switch connector J2, located on the RF/IF motherboard to provide power and control inputs to the ANS module.

APPENDIX C

REFERENCE GENERATOR (10^{-7}), TYPE 794139-1

The type 794139-1 Reference Generator (REF) is an option available for the WJ-8616A and the WJ-8617A receivers. This subassembly provides a frequency accuracy of one part in 10^{-7}.

The difference between the standard type 794098 reference generator and the type 794139-1 REF option is in the frequency determining network. The REF option utilizes a 10 MHZ oven controlled crystal oscillator to generate a highly stable 10 MHZ frequency which is frequency divided to produce the various reference frequencies required throughout the receiver. The use of an oven controlled crystal reduces the susceptibility, of the oscillator, to frequency drift due to temperature variations.

The output signal levels and the pin configuration of the type 794139-1 REF option are identical to the standard type 794098 reference generator, permitting interchangeability of the circuit boards with no additional circuit modifications required. Installation of the REF option consists of simply inserting the type 794139-1 circuit board into the existing A4A1 connector on the synthesizer motherboard (A4).

APPENDIX D

488 IEEE-488 INTERFACE, TYPE 794116

The IEEE-488 Interface option (488) is available for all receivers in the WJ-8610 series. This interface provides remote capabilities for the receiver by interfacing with a large array of compatible instruments. The 488 option provides talk and listen capabilities between the receiver and external equipment such as calculators, microcomputers or other IEEE-488 equipped receivers (when at least one of the receivers is equipped with an IEEE-488 Bus Controller). The data is transferred between units in bit-parallel, byte serial form, permitting rapid data transfer.

The 488 utilizes sixteen transmission lines consisting of eight bi-directional data bus lines, three data byte transfer lines and five interface management lines. The data bus lines transfer data or address information between devices. The data byte transfer lines indicate: the availability and validity of the information on the data bus lines; whether or not the devices are ready to accept data and whether or not the data has been accepted. The interface management lines specify whether the data bus lines are carrying data or address information, select local or remote operation, request an interrupt, clear the interface and indicate the end of a transfer sequence.

Installation of this option consists of plugging the type 794116 IEEE-488 interface into Option Slot 4 on the Digital I/O Motherboard. The option slot connector provides access to the microprocessor Data and Address busses and provides the required control signals. Mounting of the board*s remote connector to the receiver*s rear panel completes the installation.

APPENDIX E

232 RS-232 ASYNC INTERFACE, TYPE 794115

The RS-232 Asynchronous Interface bus is a standardized interface used to interface with computer peripheral equipment, such as computer terminals and line printers. It is available as an option for all of the receivers in the WJ-8610 series. The 232 option provides remote capabilities for the WJ-8610 series receivers and permits the receiver to function as part of a system by providing TALK/LISTEN capabilities.

Data is transferred to and from the receiver via two one-way data lines. The parallel data from the receiver undergoes a parallel-to-serial conversion within the RS-232 interface and is transferred serially to the external equipment via the TX data line. Serial data from external equipment is received via the RX data line, undergoes a serial-to-parallel conversion and is supplied to the microprocessor in parallel form. The data signaling rate is selectable between 300 and 9600 baud. A DIP switch (S2) on the RS-232 circuit board permits selection of the signaling rate.

In addition to the two one-way data lines, associated bus control handshake lines may be used to control the data flow between the receiver and the external equipment. These lines include:

1) RTS (Request To Send)

2) CTS (Clear To Send)

3) DCD (Data Carrier Detect)

Installation of the 232 option is accomplished by inserting the type 794115 circuit board into Option Slot 4 on the Digital I/O Motherboard. Full access to the Address and Data busses of the microprocessor and all of the required control signals are provided by the option slot connector. In addition, the remote connector from the board must be mounted to the receiver*s rear panel to provide access to the interface by the external equipment.

Type 794115 RS-232 ASYNC. Interface

APPENDIX F

DRD DIGITAL REFRESH, TYPE 794122

The Digital Refresh Display (DRD) is an option available to the WJ-8616A, and WJ-8617A receivers. With this option incorporated, the receiver*s microprocessor is capable of providing a signal strength versus frequency plot on the signal monitor, an external display or an external plotter. The horizontal and vertical information is made available to the external equipment via the X OUT and Y OUT BNC connectors on the receiver rear panel.

The digital refresh circuit contains an on-board memory, capable of storing 256 eight bit data words. The data is supplied by the microprocessor along with address information. The address selects the memory location where the data is to be stored. The memory locations are then stepped through at a higher rate by an on-board counter to read the stored data. The data read from the memory then undergoes a digital-to-analog conversion to supply the vertical information to the output. The address information from the on-board counter also undergoes a digital-to-analog conversion to supply a linear sawtooth waveform at the horizontal output.

The installation of the DRD circuit board consists of inserting the circuit board into Option Slot 2 on the Digital I/O Motherboard (A5). The option slot connector supplies all of the required operating and control signals to the assembly. The X and Y outputs are supplied to the rear panel via cable W29. This cable plugs into J6 on the motherboard.

APPENDIX G

ASO AUDIO SCAN OUTPUT, TYPE 794150-1

The Audio Scan Output option (ASO) provides an audio frequency output that is representative of the tuned frequency of the WJ-8610 Series receiver. The output frequency varies linearly from 200 Hz (when 20 MHz is tuned) to 11 KHz (when 1100 MHz is tuned). This provides an audible tone equal to one hundred thousandth of the tuned RF Frequency.

The ASO option is comprised of a digital-to-analog converter which converts the frequency data on the data bus to a DC voltage level. The output of the D/A converter is then used to control the output frequency of the VCO circuit to provide an output frequency, within the audio range, that represents the receiver tuned frequency.

Installation of the ASO option consists of plugging the circuit board into option Slot 6 on the Digital I/O Motherboard. This provides full access to the Data bus and the required control signals. The output signal is provided to Pin 4 of J6B on the Motherboard by an existing wire wrap connection to Pin 6 of option Slot 6. Connecting P63 of cable W29 to J6 on the motherboard provides the output to J5 on the rear panel of the receiver.

APPENDIX H

WBO WIDE BAND IF OUTPUT, TYPE 724013-1

The WBO option is available for the WJ-8616A and WJ-8617A receivers. This module mounts to the underside of the WJ-8610 series receivers and provides an output to a WB IF output connector (J20) mounted on the receiver rear panel. With this option incorporated, a sample of the receivers 21.4 MHz IF is provided to the rear panel for use by external equipment.

The input signal to the wide band IF output module is taken from the second converter prior to band limiting by the IF amplifiers. This provides a 21.4 MHz IF output with a constant 4 MHz bandwidth that is independent of the bandwidth select pushbuttons on the front panel. The WBO module contains its own AGC circuitry which provides a constant -30 dBm signal (into 50 ohms) to J20. A gain control and an AGC control on the WBO circuit board permit adjustment of the output gain and the AGC threshold.

Installation of the type 724013-1, wide band IF output module consists of mounting the module in the available space on the underside of the WJ-8610 series chassis. This is accomplished using four machine screws. The electrical connections can be made as follows:

1) Connect the push-on connector of cable W30 to pins 13 and 14 of XA7 of the RF/IF motherboard (A3). (Shield to pin 14.)

2) Connect the SMC connector of cable W30 to the IF input of the WBO module (A9J2).

3) Connect the SMC connector of cable W31 to the WB IF output connector of the WBO module (A9J1).

4) Mount the BNC connector of W31 to the WB IF out cutout on the rear panel of the receiver.

5) Connect A9P1 of the WBO power cable to A3J2B on the RF/IF motherboard.

APPENDIX I

EM RAM OPTION, Type 794137-1

The RAM option (EM) extends the capabilities of the WJ-8610 Series receivers by providing an additional 1536 bytes of Random-Access-Memory. This option, along with the microprocessor*s standard memory, provides up to 96 operator programmable memory channels for use in the Step mode and up to 48 frequency bands in the Scan mode.

The type 794137-1 extended memory consists of 12 RAM integrated circuits, arranged and sequenced in pairs to provide over 1500 memory locations, eight bits wide. This portion of the extended memory can be written into and read from by the microprocessor, permitting the storage and retrieving of variable data. In addition, two EPROM Sockets are contained on the board, permitting the addition of 4 k of additional software. These EPROM*s can be read from by the microprocessor to obtain the programmed data but cannot be written into.

Installation of the Type 794137-1 RAM Option consists of plugging the circuit board into Option Slot 1 of the Digital I/O Motherboard. The option slot connector provides full access to the Data and Address busses of the microprocessor and the required control signals.

APPENDIX J

EPROM OPTION, TYPE 794136-1

The extended EPROM option (EPROM) is available for all WJ-8610 Series receivers. This option consists of four EPROM*s each providing 2048 memory locations, for a total of 8 k bytes of memory space. This Read-Only-Memory stores additional software to permit expansion of the microprocessor program. The EPROM option can also be programmed to perform special tasks, as defined by the user. These special functions can include recognition of specific signal characteristics, perform special subroutines, etc.

Installation of the EPROM option consists of plugging the EPROM circuit board into option slot 1 on the Digital I/O Motherboard. In addition, the standard microprocessor software must be modified to accommodate this option. The option slot provides full access to the microprocessor*s Data and Address Busses and the required control signals.

APPENDIX K

LOG LOG DETECTION, TYPE 861XA/LOG

The LOG Detection option (LOG) is available for both the WJ-8616A and WJ-8617A receivers. This option provides an output to rear panel connector J1 that is proportional to the log of the signal strength. The output at J1 is a dc voltage ranging from 0 to +2 Vdc. It provides 70 dB of range beginning 10 dB below the rated sensitivity of the selected IF bandwidth.

The Type 861XA/LOG, LOG Detection option consists of the Type 724017-1 21.4 MHZ LOG IF Amplifier, Type 724015-1 IF Amplifier and Switching Module, Type 724009-2 AM
Demodulator and IF Output Amplifier and all cables required for installation. The IF Amplifier and Switching Module selects a signal from the appropriate 21.4 MHZ IF Amplifier and directs the signal to either the 21.4 MHZ LOG IF Amplifier or the AM Demodulator and IF Output Amplifier (when LOG Detection is not selected). It also provides final amplification of log video signal from the 21.4 MHZ LOG IF Amplifier and threats the signal to rear panel connector J1. The 21.4 MHZ LOG IF Amplifier receives the 21.4 MHZ IF signal and provides a detected output voltage that varies logarithmically with the input signal strength. The AM Demodulator and IF Output Amplifier subassembly contains a modified input circuit to accommodate the LOG option. With the exception of the single input, this subassembly functions identically to the standard AM Demodulator and IF Output Amplifier.

Installation of the LOG Detection option consists of mounting the Type 724017-1 21.4 MHZ LOG IF Amplifier and Type 724015-1 IF Amplifier and Switching Module in the

space provided on the underside of the receiver chassis and inserting the Type 724009-2 AM Demodulator and IF Amplifier into location A3A14 on the RF/IF Motherboard. Refer to Figure K-1 for the required electrical connections.

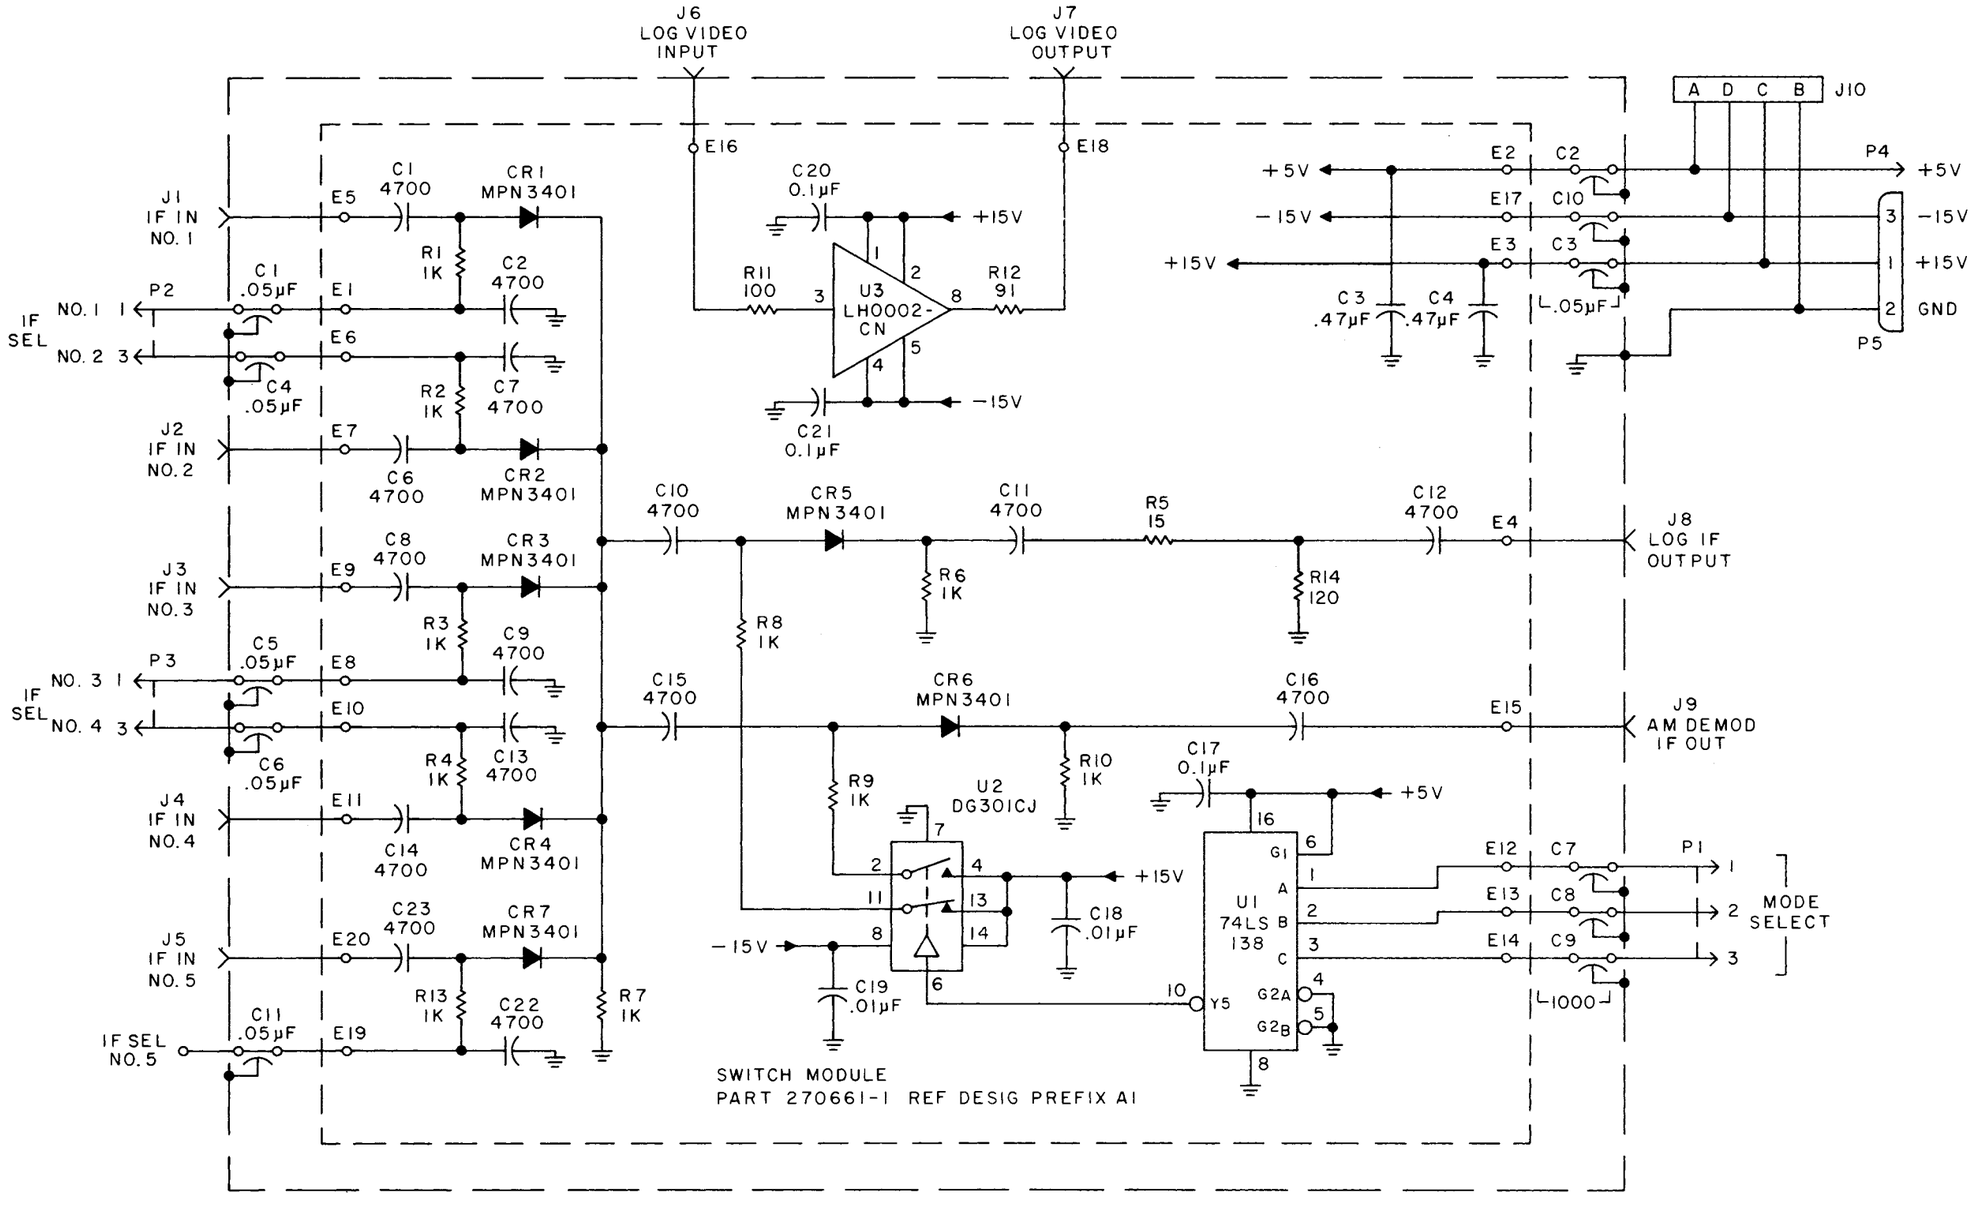
NOTES

1. UNLESS OTHERWISE SPECIFIED
   a) RESISTANCE IS IN OHMS ±5%, 1/4W
   b) CAPACITANCE IS pF
2. CW ON POTENTIOMETERS INDICATES FULL CLOCKWISE POSITION OF ACTUATOR.
3. LEAD ARRANGEMENT FOR U1 THRU U8 IS SHOWN IN DETAIL A

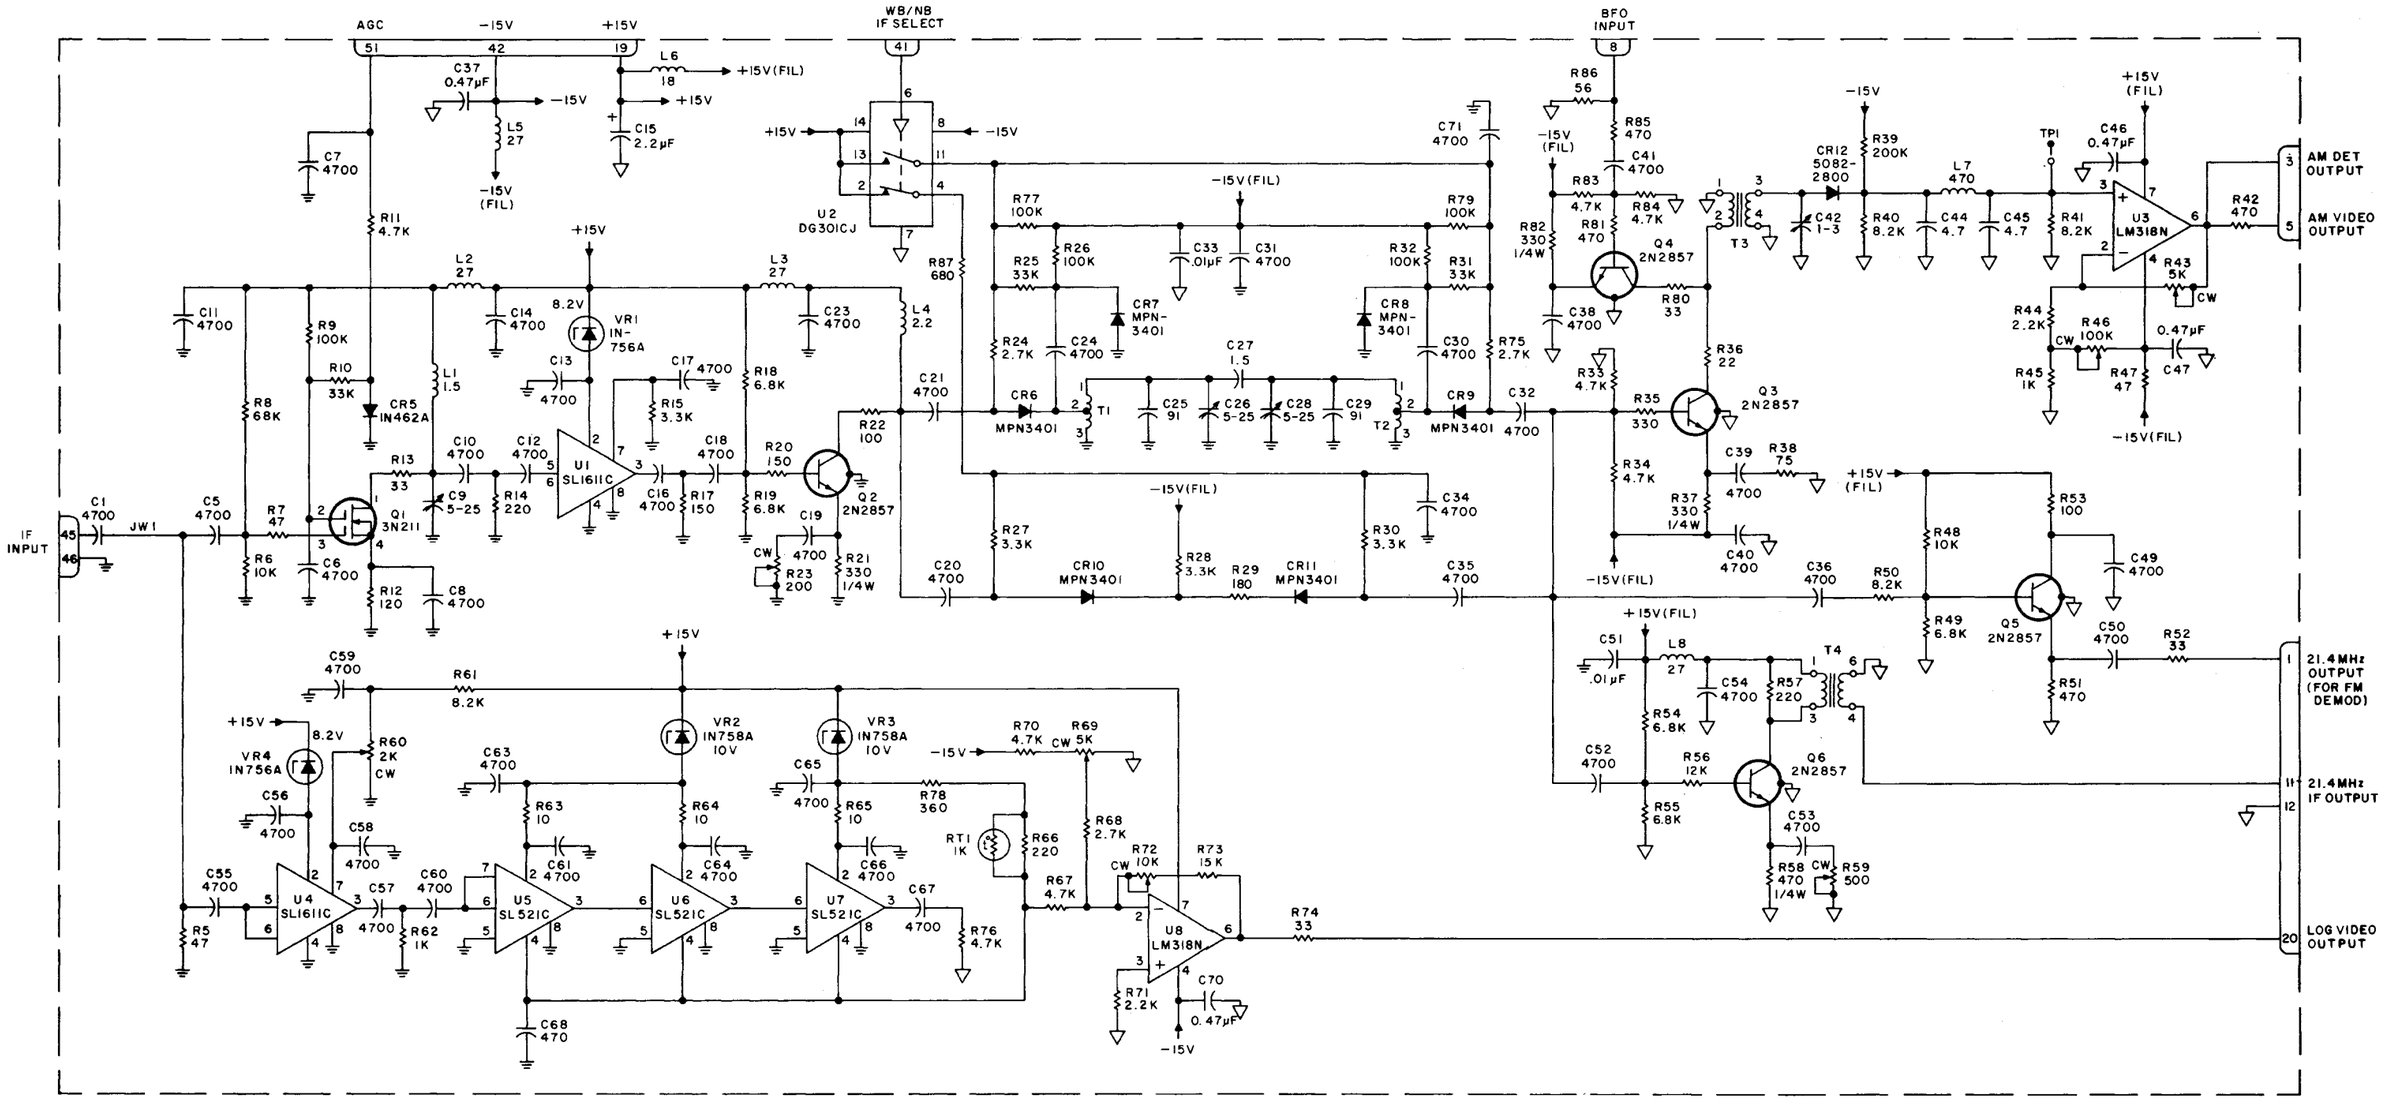
DETAIL A

Figure K-2. Type 724017-1 21.4 MHz IF Amplifier Assembly, (LOG-A1), Schematic Diagram 470282



NOTE:
UNLESS OTHERWISE SPECIFIED:
a) RESISTANCE IS IN OHMS, ±5%, 1/4W.
b) CAPACITANCE IS IN pF.

Figure K-3. Type 724015-1 Switching Module, (LOG-A2), Schematic Diagram 470286



NOTES:
UNLESS OTHERWISE SPECIFIED:
a) RESISTANCE IS IN OHMS, ±5%, 1/8W.
b) CAPACITANCE IS IN pF.
c) INDUCTANCE IS IN µH.

Figure K-4. Type 724009-2 AM Demodulator/IF Output Amplifier, (LOG-A3), Schematic Diagram 570156

Switch S1 on A1A2

Position	Front Panel Definition
1	FE (Frequency Extender)*, enabled by closing switch position 1.
2	SSb (allows selection of sideband operation)*, enabled by closing switch position 2.
5	HF (allows tuning to 2 MHz; requires HF Input Filter subassembly)*, enabled by closing switch position 5.
7	dEF (front panel definitions)*, with switch position 7 closed, the definitions may be modified by the front panel, otherwise, definitions may only be examined.
8	d1AG (diagnostics, refer to **paragraph 4.5.1**) This switch is an override for test purposes. This function is enabled by closing switch position 8.

Switch S2 on A1A2

Position	Front Panel Definition
1 thru 5	488 (selection of 488 address 0 to 30). Refer to **paragraph 2.2.1.2** for switch setting. Least significant digit is position 5 and the most significant digit is position 1.
6	SLA (slave operation, allows receiver to be controlled by WJ-861X family of receiver). This function is enabled by closing switch position 6.
8	PrES (optional internal Tracking Preselector).* This function is enabled by closing switch position 8.

Switch position 1 of DIP switch S1 allows front panel selection via the tuning wheel.

* If position 1 of DIP switch S1 is closed, this function can be disabled via the tuning wheel. If position 1 is open, this function cannot be enabled via the tuning wheel.

If the front panel definitions are not enabled, this function is controlled by its DIP switch position. Otherwise, this function is controlled via the tuning wheel.
